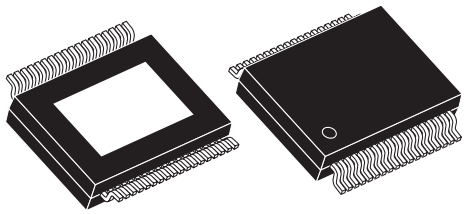
TDA7491LP

5 W + 5 W dual BTL class-D audio amplifier

Features

- 5W + 5 W continuous output power: R_L = 8Ω, THD = 10% at V_{CC} = 9 V
- 5W + 5W continuous output power: R_L = 4Ω, THD = 10% at V_{CC} =6 V
- Wide range single supply operation (5 V - 14 V)
- High efficiency (η= 90%)
- Four selectable, fixed gain settings of nominally 20 dB, 26 dB, 30 dB and 32 dB
- Differential inputs minimize common-mode noise
- Filterless operation
- No 'pop' at turn-on/off
- Standby and mute features
- Short-circuit protection
- Thermal overload protection
- Externally synchronizable



PowerSSO-36 with exposed pad (or slug) down

Description

The TDA7491LP is a dual BTL class-D audio amplifier with single power supply designed for LCD TVs and monitors.

Thanks to the high efficiency and a slug-down package no heatsink is required.

Furthermore, the filterless operation allows a reduction in the external component count.

The TDA7491LP is pin to pin compatible with the TDA7491P and TDA7491HV.

Table 1. Device summary

Order code	Operating Temp. range	Package	Packing
TDA7491LP	0 °C to 70 °C	PowerSSO-36 (slug down)	Tube
TDA7491LP13TR	0 °C to 70 °C	PowerSSO-36 (slug down)	Tape and reel

ΔG_V	Gain matching		-1		1	dB
CT	Cross talk	f = 1 kHz		50		dB
eN	Total input noise	A Curve, G_V = 20 dB		20		μV
		f = 22 Hz to 22 kHz		25	35	
SVRR	Supply voltage rejection ratio	fr = 100 Hz, Vr = 0.5 V, C_{SVR} = 10 μF	40	50		dB
T_r, T_f	Rise and fall times			50		ns
f_{SW}	Switching frequency	Internal oscillator	290	310	330	kHz
f_{SWR}	Output switching frequency	With internal oscillator (1)	250			kHz
		With external oscillator (2)	250			
V_{inH}	Digital input high (H)		2.3			V
V_{inL}	Digital input low (L)				0.8	
Function mode	Standby, mute and play modes	STBY < 0.5 V, MUTE = X	Standby			
		STBY > 2.5 V, MUTE < 1 V	Mute			
		STBY > 2.5 V, MUTE > 2 V	Play			
A_{MUTE}	Mute attenuation	VMute = 1 V	60	80		dB

1. $f_{SW} = 10^2 / (64 * R_{OSC} + 440)$ kHz, $f_{SYNCLK} = 2 * f_{SW}$ with R1 = 3 kΩ (see *Figure 20.*
2. $f_{SW} = f_{SYNCLK} / 2$ with the frequency of the external oscillator.

4 Characterization curves

The following characterization curves were made using the TDA7491LP demo board. The LC filter for the 4 Ω load used 15 µH and 470 nF components, whilst that for the 6 Ω load used 22 µH and 220 nF and that for the 8 Ω load used 33 µH and 220 nF.

All other test conditions are given along side the corresponding curves.

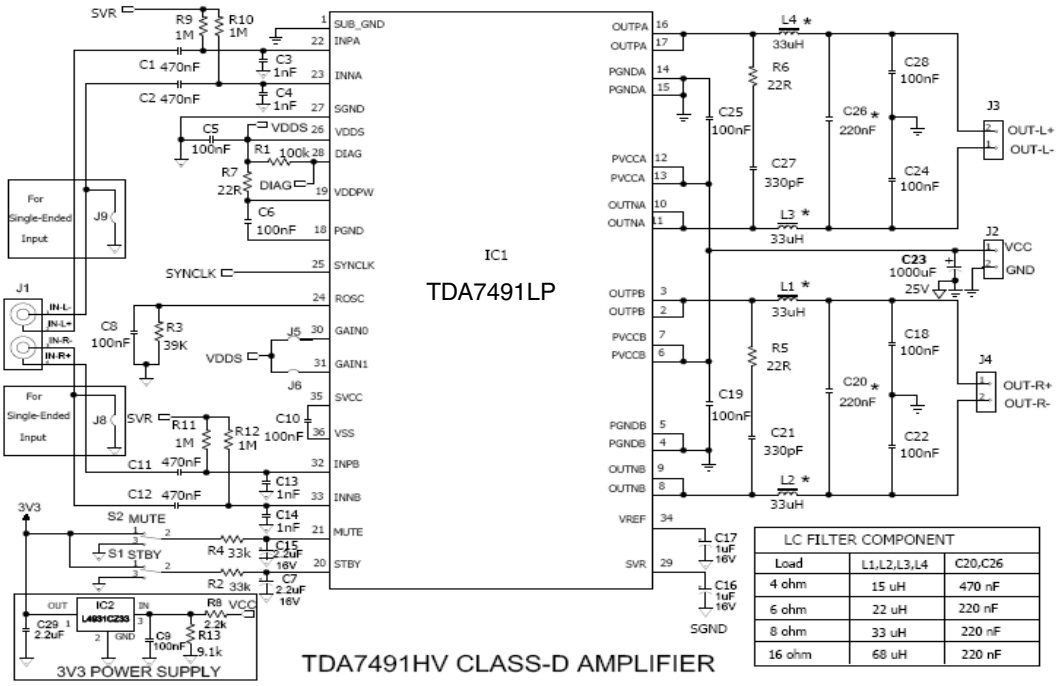
In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Pb-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark.

ECOPACK specifications are available at: http://www.st.com.

6 Application circuit

Figure 20. Application circuit



Input settings for gain:

GAIN0 : GAIN1	Nominal gain
0 V : 0 V	20 dB
0 V : 3.3 V	26 dB
3.3 V : 0 V	30 dB
3.3 V : 3.3 V	32 dB

Input settings for standby, mute and play:

STBY : MUTE	Mode
0 V : 0 V	Standby
0 V : 3.3 V	Standby
3.3 V : 0 V	Mute
3.3 V : 3.3 V	Play

7 Application information

7.1 Mode selection

The three operating modes of the TDA7491LP are set by the two inputs STBY (pin 20) and MUTE (pin 21).

- Standby mode: all circuits are turned off, very low current consumption.
- Mute mode: inputs are connected to ground and the positive and negative PWM outputs are at 50% duty cycle.
- Play mode: the amplifiers are active.

The protection functions of the TDA7491LP are realized by pulling down the voltages of the STBY and MUTE inputs shown in *Figure 21*. The input current of the corresponding pins must be limited to 200 µA.

Table 7. Mode settings

Mode Selection	STBY	MUTE
Standby	L (1)	X (don't care)
Mute	H (1)	L
Play	H	H

1. Drive levels defined in *Table 5: Electrical specifications on page 6*

Figure 21. STBY and MUTE circuit

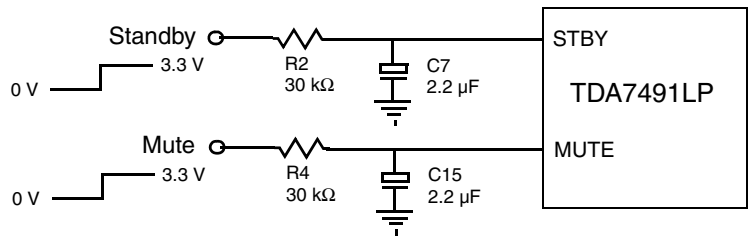


Figure 22. Turn on/off sequence for minimizing speaker "pop"

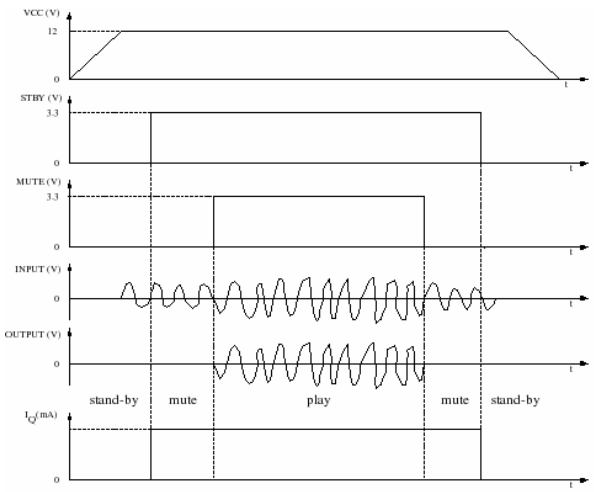


7.2 Gain setting

The gain of the TDA7491LP is set by the two inputs, GAIN0 (pin 30) and GAIN1 (pin 31). Internally, the gain is set by changing the feedback resistors of the amplifier.

Table 8. Gain settings

GAIN0	GAIN1	Nominal gain, G_V (dB)
0	0	20
0	1	26
1	0	30
1	1	32

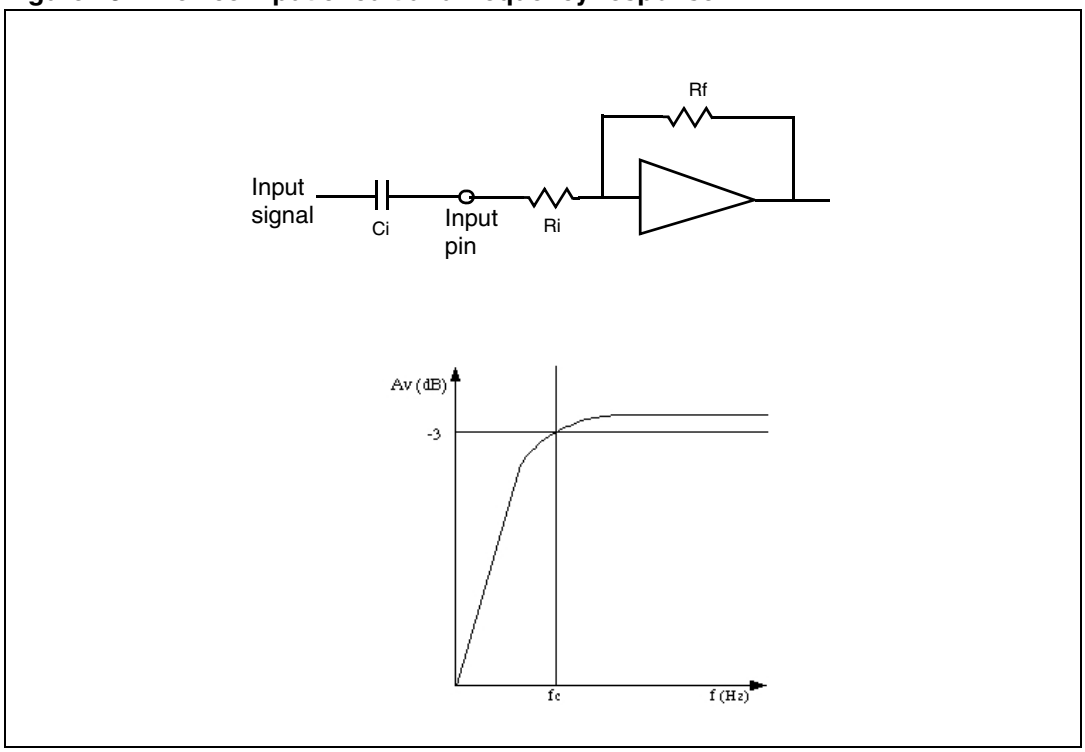
7.3 Input resistance and capacitance

The input impedance is set by an internal resistor Ri = 60 kΩ (typical). An input capacitor (Ci) is required to couple the AC input signal.

The equivalent circuit and frequency response of the input components are shown in *Figure 23*. For Ci = 220 nF the high-pass filter cut-off frequency is below 20 Hz:

$$fc = 1 / (2 * \pi * Ri * Ci)$$

Figure 23. Device input circuit and frequency response



7.4 Internal and external clocks

The clock of the class-D amplifier can be generated internally or can be driven by an external source.

If two or more class-D amplifiers are used in the same system, it is recommended that all devices operate at the same clock frequency. This can be implemented by using one TDA7491LP as master clock, while the other devices are in slave mode (that is, externally clocked. The clock interconnect is via pin SYNCLK of each device. As explained below, SYNCLK is an output in master mode and an input in slave mode.

7.4.1 Master mode (internal clock)

Using the internal oscillator, the output switching frequency, f_{SW}, is controlled by the resistor, R_{OSC}, connected to pin ROSC:

$$f_{SW} = 10^6 / (64 * R_{OSC} + 440)\ kHz$$

where R_{OSC} is in kΩ

In master mode, pin SYNCLK is used as a clock output pin, whose frequency is:

$$f_{SYNCLK} = 2 * f_{SW}$$

For master mode to operate correctly then resistor R_{OSC} must be less than 60 kΩ as given below in *Table 9*.

7.4.2 Slave mode (external clock)

In order to accept an external clock input the pin ROSC must be left open, that is, floating. This forces pin SYNCLK to be internally configured as an input as given in *Table 9*.

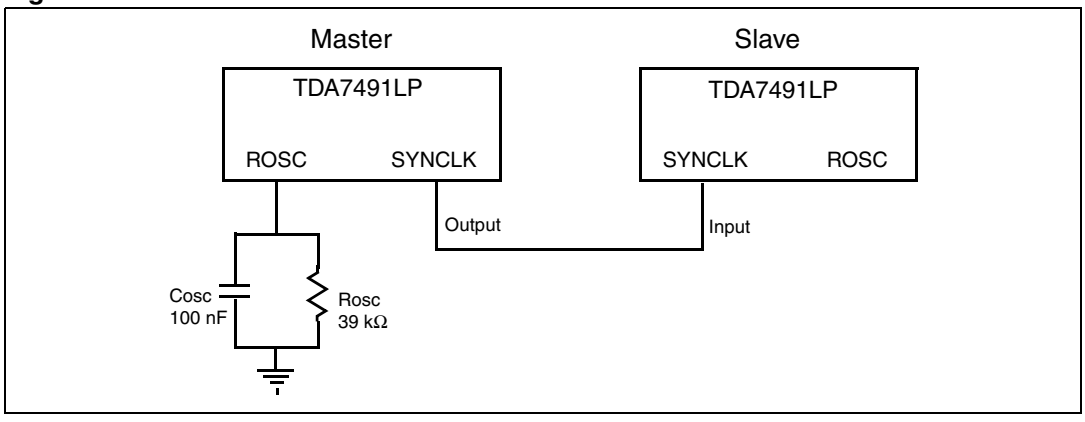
The output switching frequency of the slave devices is:

$$f_{SW} = f_{SYNCLK} / 2$$

Table 9. How to set up SYNCLK

Mode	ROSC	SYNCLK
Master	R_{OSC} < 60 kΩ	OUTPUT
Slave	Floating (not connected)	INPUT

Figure 24. Master and Slave Connection



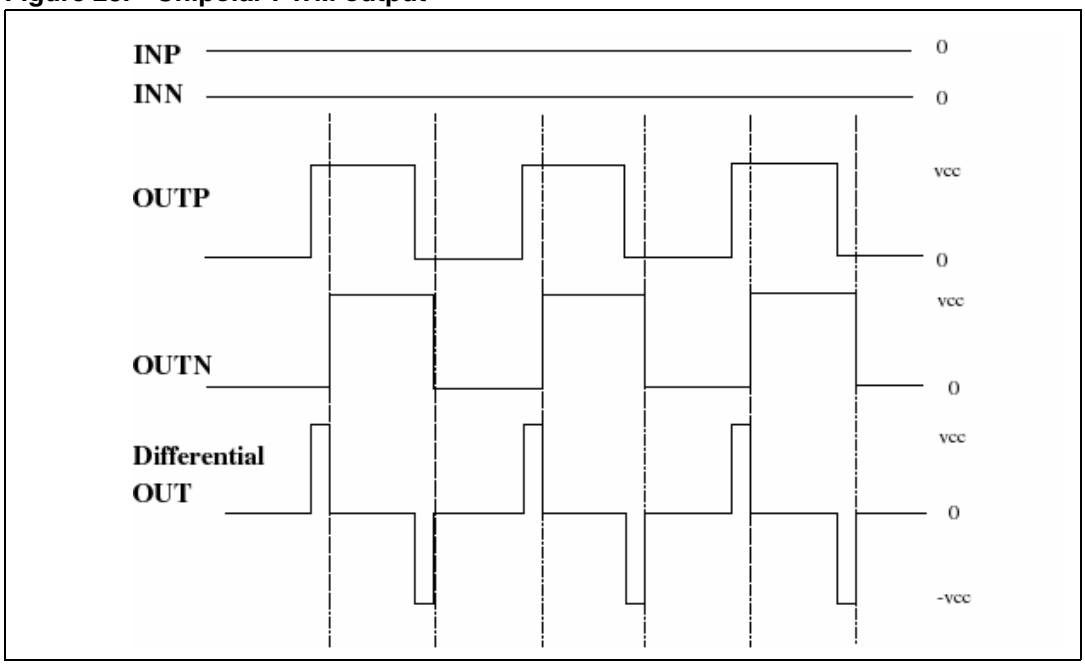
7.5 Filterless modulation

The output modulation scheme of the BTL is called unipolar pulse width modulation (PWM). The differential output voltages change between zero and +Vcc and between zero and -Vcc. This is in contrast to the traditional bipolar PWM outputs which change between +Vcc and -Vcc.

An advantage of this scheme is that it effectively doubles the switching frequency of the differential output waveform. The OUTP and OUTN are in the same phase when the input is zero, then the switching current is low and the loss in the load is small. In practice, a short delay is introduced between these two outputs in order to avoid the BTL output switching at the same time.

TDA7491LP can be used without a filter before the speaker, because the frequency of the TDA7491LP output is beyond the audio frequency, the audio signal can be recovered by the inherent inductance of the speaker and natural filter of the human ear.

Figure 25. Unipolar PWM output



7.6 Output low-pass filter

To avoid EMI problems, it may be necessary to use a low-pass filter before the speaker. The cutoff frequency should be larger than 22 kHz and much lower than the output switching frequency. It is necessary to choose the L-C component values depending on the loud speaker impedance. Some typical values, which give a cut-off frequency of 27 kHz, are shown in *Figure 26* and *Figure 27* below.

Figure 26. Typical LC filter for a 8-Ω speaker

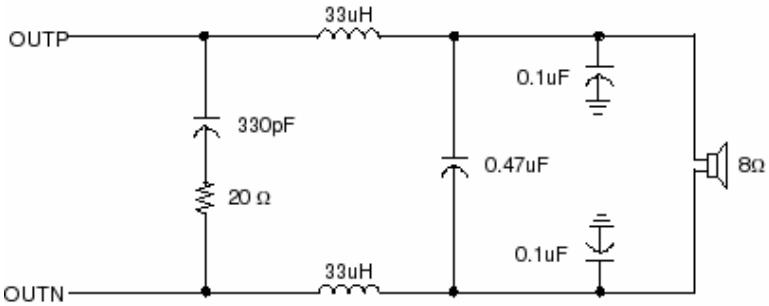


Figure 27. Typical LC filter for a 4-Ω speaker

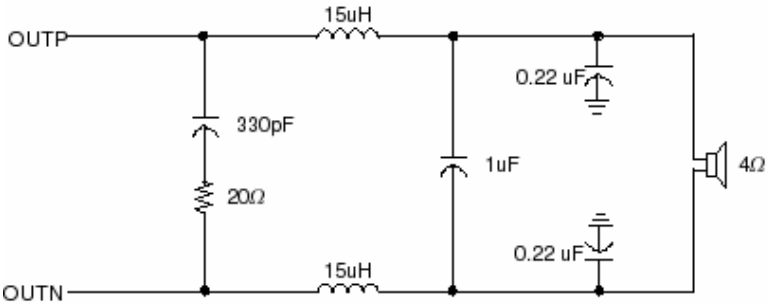


7.7 Protection function

The TDA7491LP is fully protected against over-voltages, under-voltages, over- currents and thermal overloads as explained here. See also *Table 5: Electrical specifications on page 6*.

Over voltage protection (OVP)

If the supply voltage exceeds 18V (nominal) the over voltage protection is activated which forces the outputs to the high-impedance state. When the supply voltage drops to below the threshold value the device restarts.

Under voltage protection (UVP)

If the supply voltage drops below 4 V (nominal) the under voltage protection is activated which forces the outputs to the high-impedance state. When the supply voltage recovers the device restarts.

Over current protection (OCP)

If the output current exceeds 3.5 A (nominal) the over current protection is activated which forces the outputs to the high-impedance state. Periodically, the device attempts to restart. If the over-current condition is still present then the OCP remains active. The restart time, T_{OC}, is determined by the R-C components connected to pin STBY.

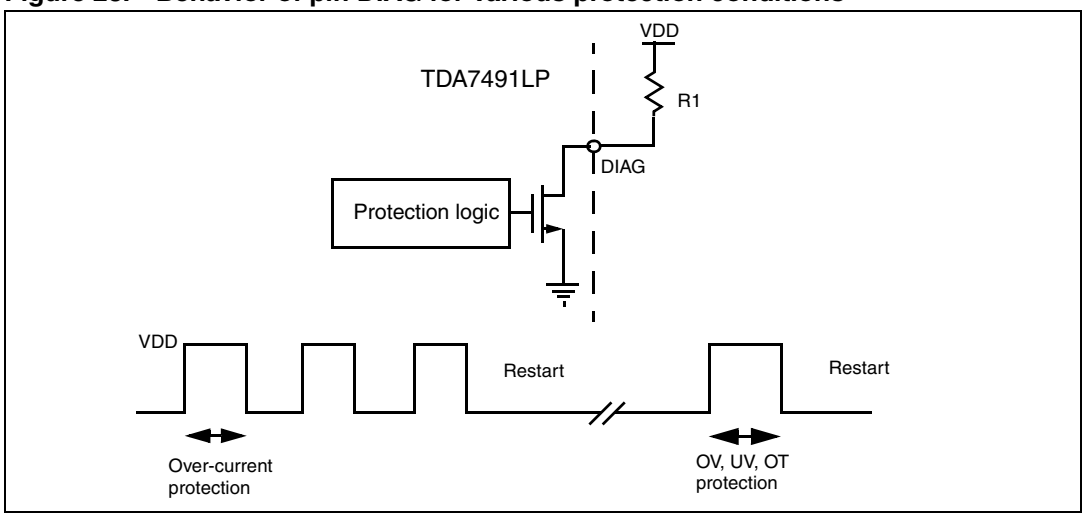
Thermal protection (OTP)

If the junction temperature, T_j, reaches 145 °C (nominally), the device goes to mute mode and the positive and negative PWM outputs are forced to 50% duty cycle. At Tj = 155 °C (nominally), the device shuts down and the output is forced to the high impedance state. When the device cools sufficiently the device restarts.

7.8 Diagnostic output

The output pin DIAG is an open drain transistor. When the protection is activated it is in the high-impedance state. The pin can be connected to a power supply (< 18 V) by a pull-up resistor whose value is limited by the maximum sinking current (200 µA) of the pin.

Figure 28. Behavior of pin DIAG for various protection conditions



7.9 Heatsink requirements

A thermal resistance of 24 °C/W can be obtained using the PCB copper ground layer with 16 vias connecting it to the contact area for the slug. Ensure that the copper ground area is a nominal 9 cm² for 24 °C/W.

Figure 29 shows the derating curves for copper areas of 4 cm² and 9 cm².

As with most amplifiers, the power dissipated within the device depends primarily on the supply voltage, the load impedance and the output modulation level.

The maximum estimated power dissipation for the TDA7491LP is less than 2W. When properly mounted on the above PCB the junction temperature could increase by 48 °C. However, with a musical program the dissipated power is about 40% less, leading to a temperature increase of around 30 C. Even at the maximum recommended ambient temperature for consumer applications of 50° C there is still a clear safety margin before the maximum junction temperature (150 °C) is reached.

Figure 29. Power derating curves for PCB used as heatsink
