

# LMK04906 Ultra Low Noise Clock Jitter Cleaner/Multiplier with 6 Programmable Outputs

Check for Samples: [LMK04906](#)

## FEATURES

- **Ultra-Low RMS Jitter Performance**
  - 100 fs RMS jitter (12 kHz to 20 MHz)
  - 123 fs RMS jitter (100 Hz to 20 MHz)
- **Dual Loop PLLatinum™ PLL Architecture**
  - PLL1
    - Integrated Low-Noise Crystal Oscillator Circuit
    - Holdover mode when input clocks are lost
      - Automatic or manual triggering/recovery
  - PLL2
    - Normalized [1 Hz] PLL noise floor of -227 dBc/Hz
    - Phase detector rate up to 155 MHz
    - OSCin frequency-doubler
    - Integrated Low-Noise VCO
- **3 redundant input clocks with LOS**
  - Automatic and manual switch-over modes
- **50% duty cycle output divides, 1 to 1045 (even and odd)**
- **LVPECL, LVDS, or LVCMOS programmable outputs**
- **Precision digital delay, fixed or dynamically adjustable**
- **25 ps step analog delay control.**
- **6 differential outputs. Up to 12 single ended.**
  - Up to 5 VCXO/Crystal buffered outputs
- **Clock rates of up to 2600 MHz**
- **0-delay mode**
- **Three default clock outputs at power up**
- **Multi-mode: Dual PLL, single PLL, and clock distribution**
- **Industrial Temperature Range: -40 to 85 °C**
- **3.15 V to 3.45 V operation**
- **Package: 64-pin QFN (9.0 x 9.0 x 0.8 mm)**

## APPLICATIONS

- **10G/40G/100G OTN line cards**
- **SONET/SDH OC-48/STM-16 and OC-192/STM-64 line cards**
- **GbE/10GbE, 1/2/4/8/10GFC line cards**
- **ITU G.709 and custom FEC line cards**
- **Synchronous Ethernet**
- **Optical modules**
- **DSLAM/MSANs**
- **Test and measurement**
- **Broadcast video**
- **Wireless basestations**
- **Data converter clocking**
- **Microwave ODU and IDUs for Wireless Backhaul**

## DESCRIPTION

The LMK04906 is the industry's highest performance clock jitter attenuator with superior clock jitter cleaning, generation, and distribution with advanced features to meet high performance timing application needs.

The LMK04906 accepts 3 clock input ranging from 1 kHz to 750 MHz and generates 6 unique clock output frequencies ranging from 2.26 MHz to 2.6 GHz. The LMK04906 can also buffer a crystal or VCXO to generate a 7<sup>th</sup> unique clock frequency.

The device provides virtually all frequency translation combination required for SONET, Ethernet, Fibre Channel and multi-mode Wireless Base Stations.

The LMK04906 input clock frequency and clock multiplication ratio are programmable through a SPI interface.

Device	VCO Frequency
LMK04906	2370 to 2600 MHz

## DEVICE CONFIGURATION INFORMATION

NSID	Reference Inputs	Dedicated Buffered/Divided OSCin Clock	Programmable LVDS/LVPECL/LVCMOS Outputs <sup>(1)</sup>	VCO
LMK04906BISQ	3	1	6	2370 to 2600 MHz

(1) Up to 2 of these outputs are also able to be driven by the OSCin clock.

## Common Frequency Plans

Standard/Application	Output Frequencies	VCO Frequency	Recommended Crystal Value
Infiniband	100, 200	2400 MHz	20 MHz
SATA	75, 150, 300, 600		
SAS	37.5, 75, 120, 150		
Fast Ethernet	25	2500 MHz	
1 GbE	125		
10 GbE	156.25, 312.5, 625		
XAUI	78.125, 156.25, 312.5		
Backplane	227.27...		
2G/4G/16G Fiber Channel	106.25, 212.5	2550 MHz	
10G Fiber Channel	159.375		
40/100 GbE	644.53125, 322.265625, 161.1328125	2578.125 MHz	12.5 MHz
SONET	19.44, 38.88, 77.76, 155.52, 311.04, 622.08	2488.32 MHz	19.44 MHz
A/D Clocking	30.72, 61.44, 122.88, 153.6, 245.76, 491.52, 983.04	2457.6 MHz	19.2 MHz or 12.288 MHz

## Achievable Frequencies

By using the tunable range of the VCO followed by a programmable divider, the LMK04906 can achieve any of the frequencies in the table below

Output Divider Value	Achieved Frequency (MHz)
1	2370 - 2600
2	1185 - 1300
3	790 - 866.7
4	592.5 - 650
5	474 - 520

Output Divider Value	Achieved Frequency (MHz)
6	395.7 - 433
7	338.6 - 371.4
8	296.25 - 325
9	263.3 - 288.9
10	263.3 - 288.9 10 237 - 260
11 to 1045	Any frequency in the range of 2.27 - 236.36

## Functional Block Diagrams and Operating Modes

The LMK04906 is a flexible device that can be configured for many different use cases. The following simplified block diagrams help show the user the different use cases of the device.

### Dual PLL

Figure 3 illustrates the typical use case of the LMK04906 in dual loop mode. In dual loop mode the reference to PLL1 is either CLKIn0, CLKIn1, or CLKIn2. An external VCXO or tunable crystal will be used to provide feedback for the first PLL and a reference to the second PLL. This first PLL cleans the jitter with the VCXO or low cost tunable crystal by using a narrow loop bandwidth. The VCXO or tunable crystal output may be buffered through the OSCOut0 port and optionally on up to 2 of the CLKOuts. The VCXO or tunable crystal is used as the reference to PLL2 and may be doubled using the frequency doubler. The internal VCO drives up to six divide/delay blocks which drive 6 clock outputs.

Holdover functionality is optionally available when the input reference clock is lost. Holdover works by fixing the tuning voltage of PLL1 to the VCXO or tunable crystal.

It is also possible to use an external VCO in place of PLL2's internal VCO.

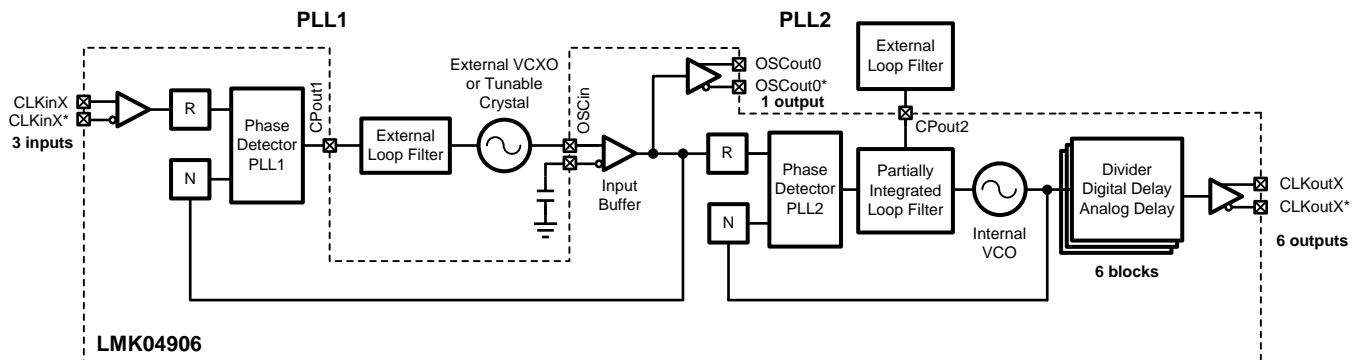

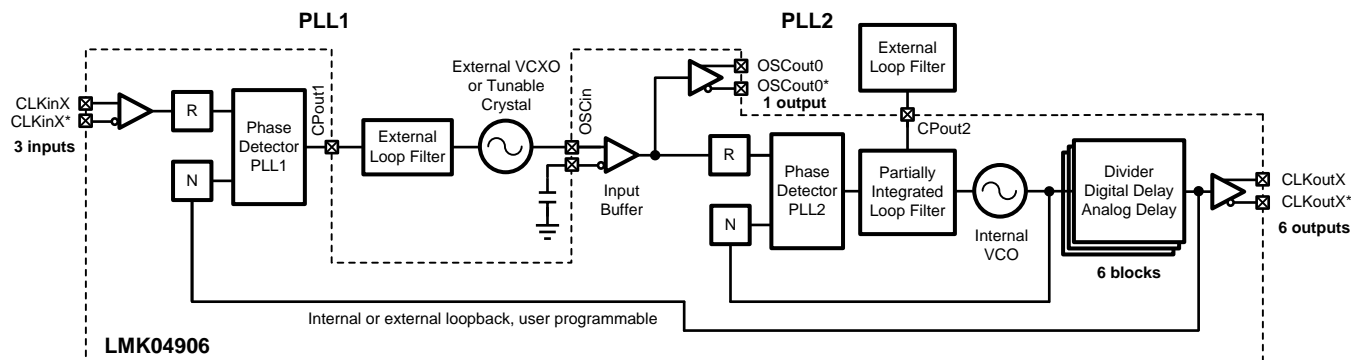

Figure 3. Simplified Functional Block Diagram for Dual Loop Mode

### 0-Delay Dual PLL

Figure 4 illustrates the use case of 0-delay dual loop mode. This configuration is very similar to Dual PLL except that the feedback to the first PLL is driven by a clock output. This causes the clock outputs to have deterministic phase with the clock input. Since all the clock outputs can be synchronized together, all the clock outputs can be in phase with the clock input signal. The feedback to PLL1 can be connected internally as shown, or externally using FBCLKin (CLKIn1) as an input port.

It is also possible to use an external VCO in place of PLL2's internal VCO.

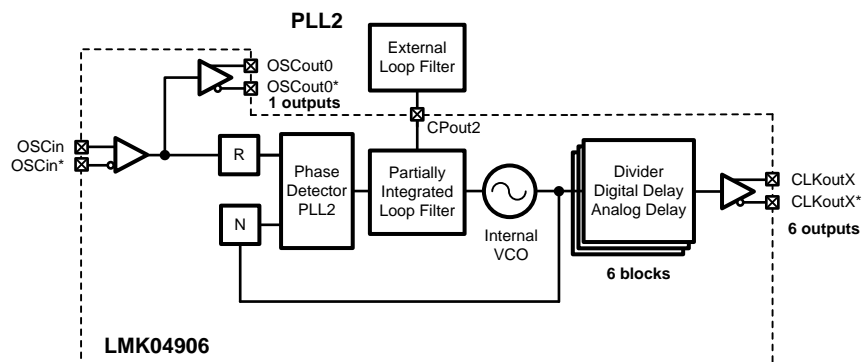

**Figure 4. Simplified Functional Block Diagram for 0-delay Dual Loop Mode**

### Single PLL

Figure 5 illustrates the use case of single PLL mode. In single PLL mode only PLL2 is used and PLL1 is powered down. OSCin is used as the reference input. The internal VCO drives up to 6 divide/delay blocks which drive 6 clock outputs. The reference at OSCin can be used to drive the OSCout0 port. OSCin can also optionally drive up to 2 of the clock outputs.

It is also possible to use an external VCO in place of PLL2's internal VCO.

**Figure 5. Simplified Functional Block Diagram for Single Loop Mode**

### 0-delay Single PLL

Figure 6 illustrates the use case of 0-delay single PLL mode. This configuration is very similar to Single PLL except that the feedback to PLL2 comes from a clock output. This causes the clock outputs to be in phase with the reference input. Since all the clock outputs can be synchronized together, all the clock outputs can be in phase with the clock input signal. The feedback to PLL2 can be performed internally as shown, or externally using FBCLKin (CLKin1) as an input port.

It is also possible to use an external VCO in place of PLL2's internal VCO.

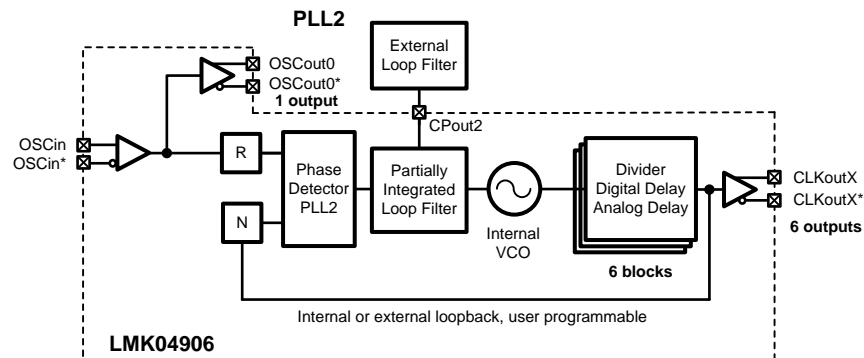

Figure 6. Simplified Functional Block Diagram for 0-delay Single Loop Mode

### Clock Distribution

Figure 7 illustrates the LMK04906 used for clock distribution. CLKin1 is used to drive up to 6 divide/delay blocks which drive 6 outputs. OSCin can be used to drive the OSCout port. OSCin can also optionally drive up to 2 of the clock outputs.

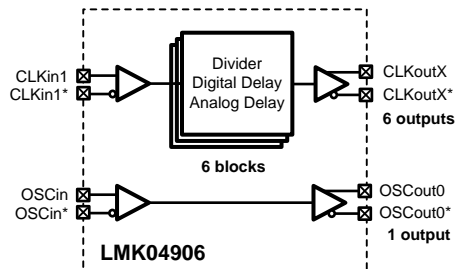

Figure 7. Simplified Functional Block Diagram for Mode Clock Distribution

### Detailed LMK04906 Block Diagram

Figure 8 illustrates the complete LMK04906 block diagram for the LMK04906 family.

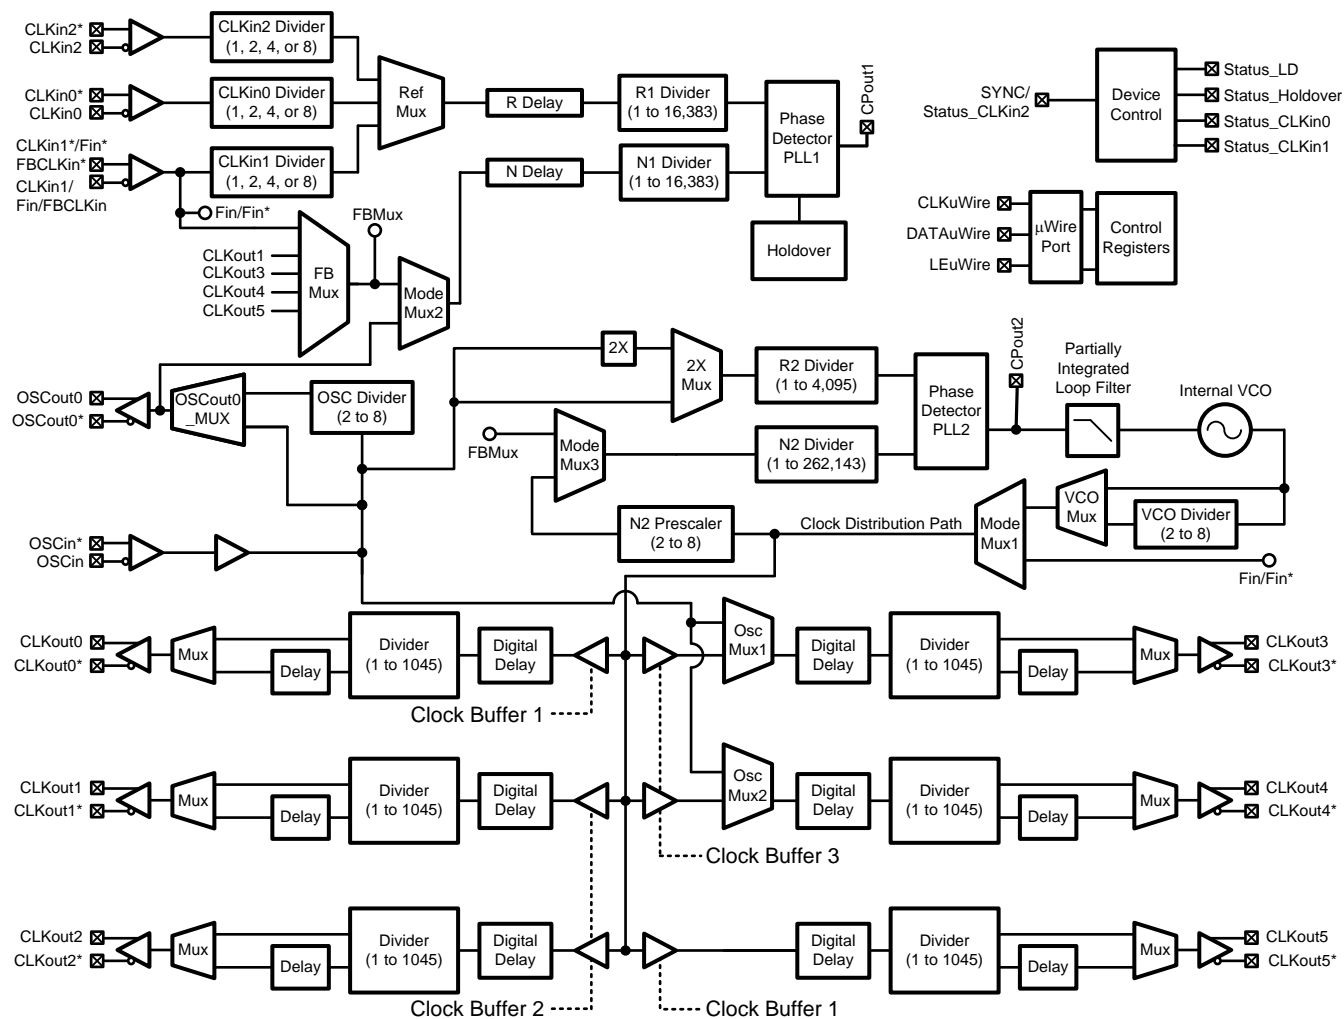

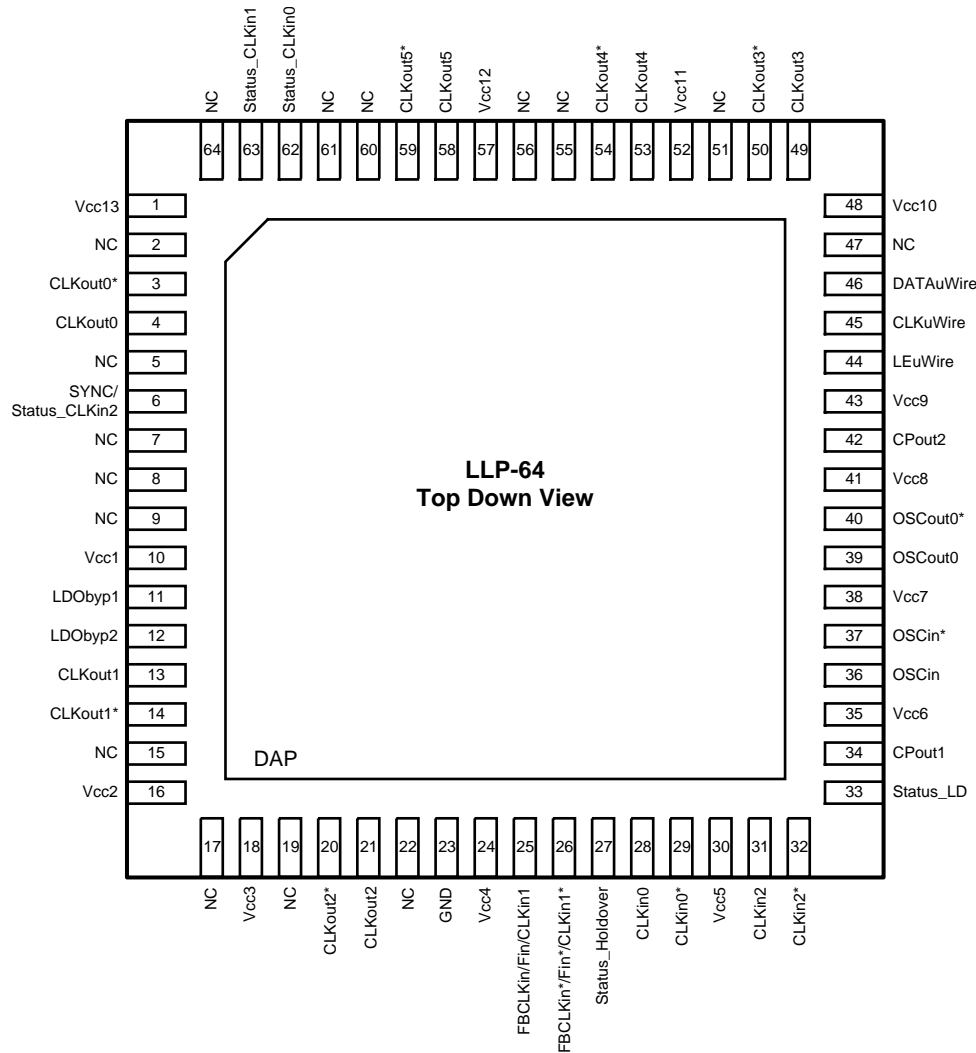

Figure 8. Detailed LMK04906 Block Diagram

## Connection Diagram

**Figure 9. 64-Pin QFN Package**

## Pin Descriptions <sup>(1)</sup>

Pin Number	Name(s)	I/O	Type	Description
1	Vcc13		PWR	Power Supply for CLKou0
2, 5, 7, 8, 9, 15, 17, 19, 22, 47, 51, 55, 56, 60, 61, 64	NC		No Connect	These pins must be left floating.
3, 4	CLKout0*, CLKout0	O	Programmable	Clock output 0.
6	SYNC / Status_CLKin2	I/O	Programmable	CLKout Synchronization input or CLKin2 Status output.
10	Vcc1		PWR	Power supply for VCO LDO.
11	LDObyp1		ANLG	LDO Bypass, bypassed to ground with 10 $\mu$ F capacitor.
12	LDObyp2		ANLG	LDO Bypass, bypassed to ground with a 0.1 $\mu$ F capacitor.

(1) See Application Information section for recommended connections.

Pin Number	Name(s)	I/O	Type	Description
13, 14	CLKout1, CLKout1*	O	Programmable	Clock output 1.
16	Vcc2		PWR	Power supply for CLKout1.
18	Vcc3		PWR	Power supply for CLKout2
20, 21	CLKout2*, CLKout2	O	Programmable	Clock output 2
23	GND		PWR	Ground
24	Vcc4		PWR	Power supply for digital.
25, 26	CLKin1, CLKin1*	I	ANLG	Reference Clock Input Port 1 for PLL1. AC or DC Coupled.
	FBCLKin, FBCLKin*			Feedback input for external clock feedback input (0-delay mode). AC or DC Coupled.
	Fin/Fin*			External VCO input (External VCO mode). AC or DC Coupled.
27	Status_Holdover	I/O	Programmable	Programmable status pin, default readback output. Programmable to holdover mode indicator. Other options available by programming.
28, 29	CLKin0, CLKin0*	I	ANLG	Reference Clock Input Port 0 for PLL1. AC or DC Coupled.
30	Vcc5		PWR	Power supply for clock inputs.
31, 32	CLKin2, CLKin2*	I	ANLG	Reference Clock Input Port 2 for PLL1, AC or DC Coupled.
33	Status_LD	I/O	Programmable	Programmable status pin, default lock detect for PLL1 and PLL2. Other options available by programming.
34	CPout1	O	ANLG	Charge pump 1 output.
35	Vcc6		PWR	Power supply for PLL1, charge pump 1.
36, 37	OSCin, OSCin*	I	ANLG	Feedback to PLL1, Reference input to PLL2. AC Coupled.
38	Vcc7		PWR	Power supply for OSCin port.
39, 40	OS Cout0, OSCout0*	O	Programmable	Buffered output 0 of OSCin port.
41	Vcc8		PWR	Power supply for PLL2, charge pump 2.
42	CPout2	O	ANLG	Charge pump 2 output.
43	Vcc9		PWR	Power supply for PLL2.
44	LEuWire	I	CMOS	MICROWIRE Latch Enable Input.
45	CLKuWire	I	CMOS	MICROWIRE Clock Input.
46	DATAuWire	I	CMOS	MICROWIRE Data Input.
48	Vcc10		PWR	Power supply for CLKout3.
49, 50	CLKout3, CLKout3*	O	Programmable	Clock output 3.
52	Vcc11		PWR	Power supply for CLKout4.
53, 54	CLKout4, CLKout4*	O	Programmable	Clock output 4.
57	Vcc12		PWR	Power supply for CLKout5.
58, 59	CLKout5, CLKout5*	O	Programmable	Clock output 5.
62	Status_CLKin0	I/O	Programmable	Programmable status pin. Default is input for pin control of PLL1 reference clock selection. CLKin0 LOS status and other options available by programming.
63	Status_CLKin1	I/O	Programmable	Programmable status pin. Default is input for pin control of PLL1 reference clock selection. CLKin1 LOS status and other options available by programming.
DAP	DAP		GND	DIE ATTACH PAD, connect to GND.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## Absolute Maximum Ratings <sup>(1) (2) (3)</sup>

Parameter	Symbol	Ratings	Units
Supply Voltage <sup>(4)</sup>	$V_{CC}$	-0.3 to 3.6	V
Input Voltage	$V_{IN}$	-0.3 to ( $V_{CC} + 0.3$ )	V
Storage Temperature Range	$T_{STG}$	-65 to 150	°C
Lead Temperature (solder 4 seconds)	$T_L$	+260	°C
Junction Temperature	$T_J$	150	°C
Differential Input Current (CLKinX/X*, OSCin/OSCin*, FBCLKin/FBCLKin*, Fin/Fin*)	$I_{IN}$	± 5	mA
Moisture Sensitivity Level	MSL	3	

- (1) "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the Electrical Characteristics. The guaranteed specifications apply only to the test conditions listed.
- (2) This device is a high performance RF integrated circuit with an ESD rating up to 2 kV Human Body Model, up to 150 V Machine Model, and up to 750 V Charged Device Model and is ESD sensitive. Handling and assembly of this device should only be done at ESD-free workstations.
- (3) Stresses in excess of the absolute maximum ratings can cause permanent or latent damage to the device. These are absolute stress ratings only. Functional operation of the device is only implied at these or any other conditions in excess of those given in the operation sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability.
- (4) Never to exceed 3.6 V.

## Package Thermal Resistance

**Table 1. 64-Lead QFN**

Parameter	Symbol	Ratings	Units
Thermal resistance from junction to ambient on 4-layer JEDEC PCB <sup>(1)</sup>	$\theta_{JA}$	19.5	° C/W
Thermal resistance from junction to case <sup>(2)</sup>	$\theta_{JC}$	1.5	° C/W

- (1) Specification assumes 32 thermal vias connect the die attach pad to the embedded copper plane on the 4-layer JEDEC PCB. These vias play a key role in improving the thermal performance of the QFN. Note that the JEDEC PCB is a standard thermal measurement PCB and does not represent best performance a PCB can achieve. It is recommended that the maximum number of vias be used in the board layout.  $\theta_{JA}$  is unique for each PCB.
- (2) Case is defined as the DAP (die attach pad).

## Recommended Operating Conditions

Parameter	Symbol	Condition	Min	Typical	Max	Unit
Junction Temperature	$T_J$				125	°C
Ambient Temperature	$T_A$	$V_{CC} = 3.3$ V	-40	25	85	°C
Supply Voltage	$V_{CC}$		3.15	3.3	3.45	V

## Electrical Characteristics

(3.15 V ≤ V<sub>CC</sub> ≤ 3.45 V, -40 °C ≤ T<sub>A</sub> ≤ 85 °C. Typical values represent most likely parametric norms at V<sub>CC</sub> = 3.3 V, T<sub>A</sub> = 25 °C, at the Recommended Operating Conditions at the time of product characterization and are not guaranteed.)

(9) This parameter is programmable

(10) A specification in modeling PLL in-band phase noise is the 1/f flicker noise, L<sub>PLL\_flicker</sub>(f), which is dominant close to the carrier. Flicker noise has a 10 dB/decade slope. PN10kHz is normalized to a 10 kHz offset and a 1 GHz carrier frequency. PN10kHz = L<sub>PLL\_flicker</sub>(10 kHz) - 20log(Fout / 1 GHz), where L<sub>PLL\_flicker</sub>(f) is the single side band phase noise of only the flicker noise's contribution to total noise, L(f). To measure L<sub>PLL\_flicker</sub>(f) it is important to be on the 10 dB/decade slope close to the carrier. A high compare frequency and a clean crystal are important to isolating this noise source from the total phase noise, L(f). L<sub>PLL\_flicker</sub>(f) can be masked by the reference oscillator performance if a low power or noisy source is used. The total PLL in-band phase noise performance is the sum of L<sub>PLL\_flicker</sub>(f) and L<sub>PLL\_flat</sub>(f).

(11) A specification modeling PLL in-band phase noise. The normalized phase noise contribution of the PLL, L<sub>PLL\_flat</sub>(f), is defined as: PN1Hz=L<sub>PLL\_flat</sub>(f) - 20log(N) - 10log(f<sub>PDx</sub>). L<sub>PLL\_flat</sub>(f) is the single side band phase noise measured at an offset frequency, f, in a 1 Hz bandwidth and f<sub>PDx</sub> is the phase detector frequency of the synthesizer. L<sub>PLL\_flat</sub>(f) contributes to the total noise, L(f).

(12) Maximum Allowable Temperature Drift for Continuous Lock is how far the temperature can drift in either direction from the value it was at the time that the R30 register was last programmed, and still have the part stay in lock. The action of programming the R30 register, even to the same value, activates a frequency calibration routine. This implies the part will work over the entire frequency range, but if the temperature drifts more than the maximum allowable drift for continuous lock, then it will be necessary to reload the R30 register to ensure it stays in lock. Regardless of what temperature the part was initially programmed at, the temperature can never drift outside the frequency range of -40 °C to 85 °C without violating specifications.

## Serial MICROWIRE Timing Diagram

Register programming information on the DATAuWire pin is clocked into a shift register on each rising edge of the CLKuWire signal. On the rising edge of the LEuWire signal, the register is sent from the shift register to the register addressed. A slew rate of at least 30 V/ $\mu$ s is recommended for these signals. After programming is complete the CLKuWire, DATAuWire, and LEuWire signals should be returned to a low state. If the CLKuWire or DATAuWire lines are toggled while the VCO is in lock, as is sometimes the case when these lines are shared with other parts, the phase noise may be degraded during this programming.

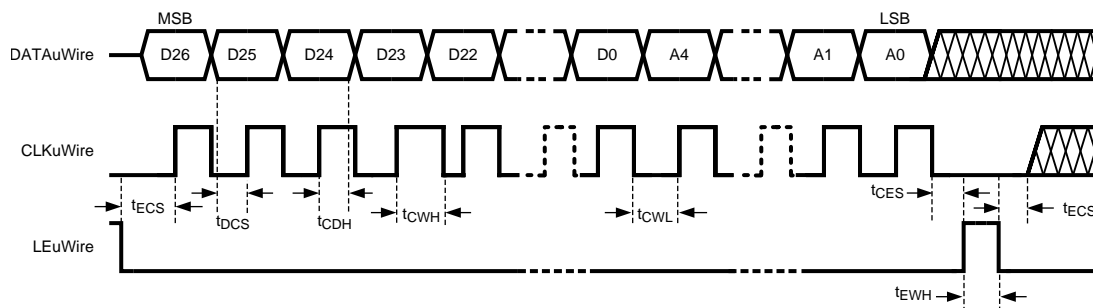

Figure 10. MICROWIRE Timing Diagram

## ADVANCED MICROWIRE TIMING DIAGRAMS

### 3 Extra Clocks or Double Program

Figure 11 shows the timing for the programming sequence for loading CLKoutX\_DIV > 25 or CLKoutX\_DDLY > 12 as described in [SPECIAL PROGRAMMING CASE FOR R0 to R5 for CLKoutX\\_DIV & CLKoutX\\_DDLY](#).

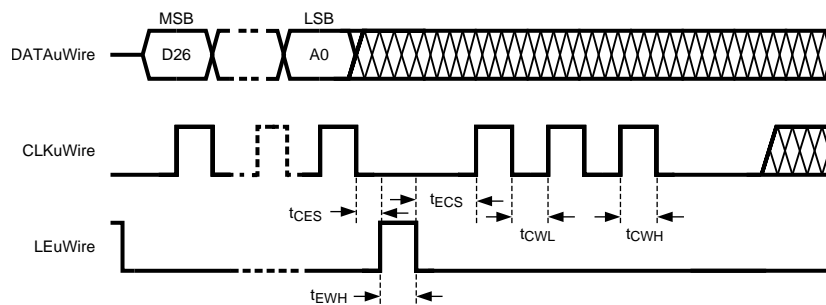

Figure 11. MICROWIRE Timing Diagram: Extra CLKuWire Pulses for R0 to R5

### Three Extra Clocks with LEuWire High

Figure 12 shows the timing for the programming sequence which allows SYNC\_EN\_AUTO = 1 when loading CLKoutX\_DIV > 25 or CLKoutX\_DDLY > 12. When SYNC\_EN\_AUTO = 1, a SYNC event is automatically generated on the falling edge of LEuWire. See [SPECIAL PROGRAMMING CASE FOR R0 to R5 for CLKoutX\\_DIV & CLKoutX\\_DDLY](#).

Figure 12. MICROWIRE Timing Diagram: Extra CLKuWire Pulses for R0 to R5 with LEuWire Asserted

### Readback

See [READBACK](#) for more information on performing a readback operation. Figure 13 shows timing for LEuWire for both READBACK\_LE = 1 and 0.

The rising edges of CLKuWire during MICROWIRE readback continue to clock data on DATAuWire into the device during readback. If after the readback, LEuWire transitions from low to high, this data will be latched to the decoded register. The decoded register address consists of the last 5 bits clocked on DATAuWire as shown in the MICROWIRE Timing Diagrams.

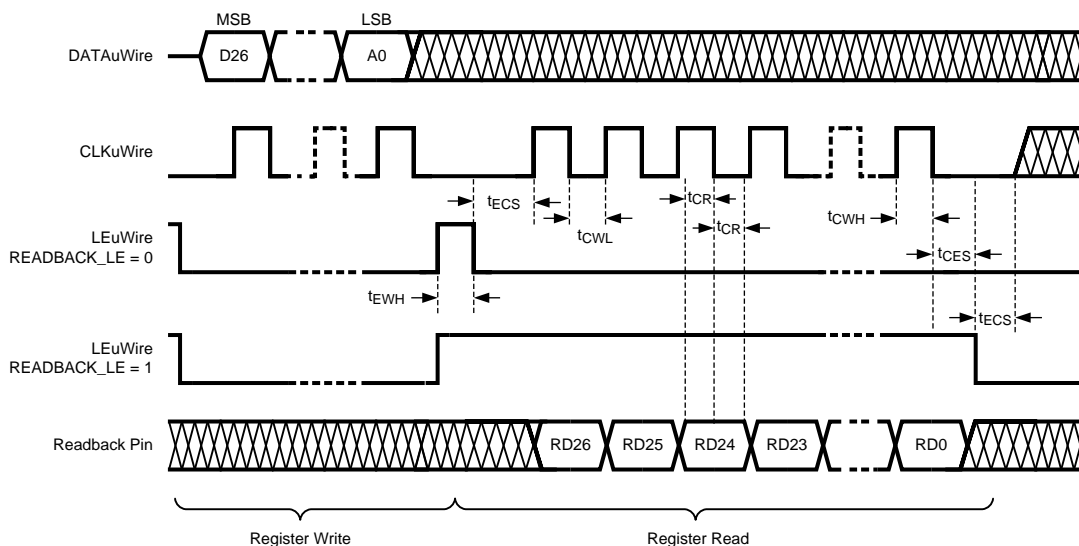

Figure 13. MICROWIRE Readback Timing Diagram

## Measurement Definitions

### CHARGE PUMP CURRENT SPECIFICATION DEFINITIONS

I1 = Charge Pump Sink Current at  $V_{CPout} = V_{CC} - \Delta V$

I2 = Charge Pump Sink Current at  $V_{CPout} = V_{CC}/2$

I3 = Charge Pump Sink Current at  $V_{CPout} = \Delta V$

I4 = Charge Pump Source Current at  $V_{CPout} = V_{CC} - \Delta V$

I5 = Charge Pump Source Current at  $V_{CPout} = V_{CC}/2$

I6 = Charge Pump Source Current at  $V_{CPout} = \Delta V$

$\Delta V$  = Voltage offset from the positive and negative supply rails. Defined to be 0.5 V for this device.

#### Charge Pump Output Current Magnitude Variation Vs. Charge Pump Output Voltage

$$I_{CPout} \text{ Vs } V_{CPout} = \frac{|I1| - |I3|}{|I1| + |I3|} \times 100\%$$

$$= \frac{|I4| - |I6|}{|I4| + |I6|} \times 100\%$$

#### Charge Pump Sink Current Vs. Charge Pump Output Source Current Mismatch

$$I_{CPout} \text{ Sink Vs } I_{CPout} \text{ Source} = \frac{|I2| - |I5|}{|I2| + |I5|} \times 100\%$$

## Charge Pump Output Current Magnitude Variation Vs. Temperature

$$I_{CPout} \text{ Vs } T_A = \frac{|I_2|_{T_A} - |I_2|_{T_A = 25^\circ\text{C}}}{|I_2|_{T_A = 25^\circ\text{C}}} \times 100\%$$

$$= \frac{|I_5|_{T_A} - |I_5|_{T_A = 25^\circ\text{C}}}{|I_5|_{T_A = 25^\circ\text{C}}} \times 100\%$$

## DIFFERENTIAL VOLTAGE MEASUREMENT TERMINOLOGY

The differential voltage of a differential signal can be described by two different definitions causing confusion when reading datasheets or communicating with other engineers. This section will address the measurement and description of a differential signal so that the reader will be able to understand and discern between the two different definitions when used.

The first definition used to describe a differential signal is the absolute value of the voltage potential between the inverting and non-inverting signal. The symbol for this first measurement is typically  $V_{ID}$  or  $V_{OD}$  depending on if an input or output voltage is being described.

The second definition used to describe a differential signal is to measure the potential of the non-inverting signal with respect to the inverting signal. The symbol for this second measurement is  $V_{SS}$  and is a calculated parameter. Nowhere in the IC does this signal exist with respect to ground, it only exists in reference to its differential pair.  $V_{SS}$  can be measured directly by oscilloscopes with floating references, otherwise this value can be calculated as twice the value of  $V_{OD}$  as described in the first description.

Figure 14 illustrates the two different definitions side-by-side for inputs and Figure 15 illustrates the two different definitions side-by-side for outputs. The  $V_{ID}$  and  $V_{OD}$  definitions show  $V_A$  and  $V_B$  DC levels that the non-inverting and inverting signals toggle between with respect to ground.  $V_{SS}$  input and output definitions show that if the inverting signal is considered the voltage potential reference, the non-inverting signal voltage potential is now increasing and decreasing above and below the non-inverting reference. Thus the peak-to-peak voltage of the differential signal can be measured.

$V_{ID}$  and  $V_{OD}$  are often defined as volts (V) and  $V_{SS}$  is often defined as volts peak-to-peak ( $V_{PP}$ ).

Figure 14. Two Different Definitions for Differential Input Signals

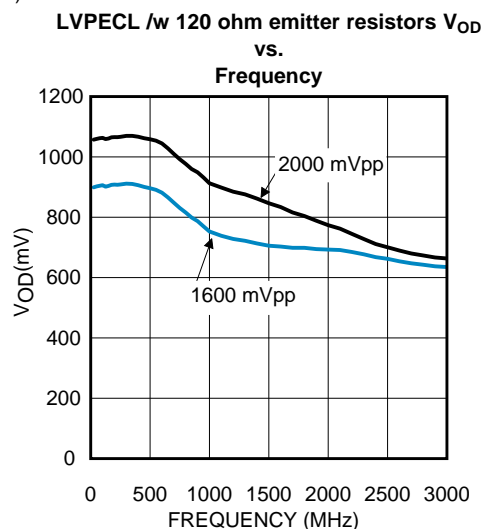

Figure 15. Two Different Definitions for Differential Output Signals

Refer to application note AN-912 Common Data Transmission Parameters and their Definitions for more information.

## Typical Performance Characteristics

### CLOCK OUTPUT AC CHARACTERISTICS

## FEATURES

### SYSTEM ARCHITECTURE

The dual loop PLL architecture of the LMK04906 provides the lowest jitter performance over the widest range of output frequencies and phase noise integration bandwidths. The first stage PLL (PLL1) is driven by an external reference clock and uses an external VCXO or tunable crystal to provide a frequency accurate, low phase noise reference clock for the second stage frequency multiplication PLL (PLL2). PLL1 typically uses a narrow loop bandwidth (10 Hz to 200 Hz) to retain the frequency accuracy of the reference clock input signal while at the same time suppressing the higher offset frequency phase noise that the reference clock may have accumulated along its path or from other circuits. This “cleaned” reference clock provides the reference input to PLL2.

The low phase noise reference provided to PLL2 allows PLL2 to operate with a wide loop bandwidth (50 kHz to 200 kHz). The loop bandwidth for PLL2 is chosen to take advantage of the superior high offset frequency phase noise profile of the internal VCO and the good low offset frequency phase noise of the reference VCXO or tunable crystal.

Ultra low jitter is achieved by allowing the external VCXO or Crystal's phase noise to dominate the final output phase noise at low offset frequencies and the internal VCO's phase noise to dominate the final output phase noise at high offset frequencies. This results in best overall phase noise and jitter performance.

The LMK04906 allows subsets of the device to be used to increase the flexibility of device. These different modes are selected using **MODE: Device Mode**. For instance:

- Dual Loop Mode - Typical use case of LMK04906. CLKinX used as reference input to PLL1, OSCin port is connected to VCXO or tunable crystal.
- Single Loop Mode - Powers down PLL1. OSCin port is used as reference input.
- Clock Distribution Mode - Allows input of CLKin1 to be distributed to output with division, digital delay, and analog delay.

See Functional Description for more information on these modes.

### **PLL1 REDUNDANT REFERENCE INPUTS (CLKin0/CLKin0\*, CLKin1/CLKin1\*, and CLKin2/CLKin2\*)**

The LMK04906 has three reference clock inputs for PLL1, CLKin0, CLKin1, and CLKin2. Ref Mux selects CLKin0, CLKin1, or CLKin2. Automatic or manual switching occurs between the inputs.

CLKin0, CLKin1, and CLKin2 each have input dividers. The input divider allows different clock input frequencies to be normalized so that the frequency input to the PLL1 R divider remains constant during automatic switching. By programming these dividers such that the frequency presented to the input of the PLL1\_R divider is the same prevents the user from needing to reprogram the PLL1 R divider when the input reference is changed to another CLKin port with a different frequency.

CLKin1 is shared for use as an external 0-delay feedback (FBCLKin), or for use with an external VCO (Fin).

Fast manual switching between reference clocks is possible with a external pins Status\_CLKin0, Status\_CLKin1, Status\_CLKin2.

### **PLL1 TUNABLE CRYSTAL SUPPORT**

The LMK04906 integrates a crystal oscillator on PLL1 for use with an external crystal and varactor diode to perform jitter cleaning.

The LMK04906 must be programmed to enable Crystal mode.

### **VCXO/CRYSTAL BUFFERED OUTPUTS**

The LMK04906 provides a dedicated output which is a buffered copy of the PLL2 reference input. This reference input is typically a low noise VCXO or Crystal. When using a VCXO, this output can be used to clock external devices such as microcontrollers, FPGAs, CPLDs, etc. before the LMK04906 is programmed.

The OSCout0 buffer output type is programmable to LVDS, LVPECL, or LVCMOS.

The dedicated output buffer OSCout0 can output frequency lower than the VCXO or Crystal frequency by programming the OSC Divider. The OSC Divider value range is 1 to 8. Each OSCoutX can individually choose to use the OSC Divider output or to bypass the OSC Divider.

Two clock outputs can also be programmed to be driven by OSCin. This allows a total of 2 additional differential outputs to be buffered outputs of OSCin. When programmed in this way, a total of 3 differential outputs can be driven by a buffered copy of OSCin.

VCXO/Crystal buffered outputs cannot be synchronized to the VCO clock distribution outputs. The assertion of SYNC will still cause these outputs to become low. Since these outputs will turn off and on asynchronously with respect to the VCO sourced clock outputs during a SYNC, it is possible for glitches to occur on the buffered clock outputs when SYNC is asserted and unasserted. If the NO\_SYNC\_CLKoutX bits are set these outputs will not be affected by the SYNC event except that the phase relationship will change with the other synchronized clocks unless a buffered clock output is used as a qualification clock during SYNC.

### **FREQUENCY HOLDOVER**

The LMK04906 supports holdover operation to keep the clock outputs on frequency with minimum drift when the reference is lost until a valid reference clock signal is re-established.

### **HITLESS SWITCHING**

The LMK04906 supports hitless switching.

## INTEGRATED LOOP FILTER POLES

The LMK04906 features programmable 3rd and 4th order loop filter poles for PLL2. These internal resistors and capacitor values may be selected from a fixed range of values to achieve either a 3rd or 4th order loop filter response. The integrated programmable resistors and capacitors complement external components mounted near the chip.

These integrated components can be effectively disabled by programming the integrated resistors and capacitors to their minimum values.

## INTERNAL VCO

The output of the internal VCO is routed to a mux which allows the user to select either the direct VCO output or a divided version of the VCO for the Clock Distribution Path. This same selection is also fed back to the PLL2 phase detector through a prescaler and N-divider.

The mux selectable VCO divider has a divide range of 2 to 8 with 50% output duty cycle for both even and odd divide values.

The primary use of the VCO divider is to achieve divides greater than the clock output divider supports alone.

## EXTERNAL VCO MODE

The Fin/Fin\* input allows an external VCO to be used with PLL2 of the LMK04906.

Using an external VCO reduces the number of available clock inputs by one.

## CLOCK DISTRIBUTION

The LMK04906 features a total of 6 outputs driven from the internal or external VCO.

All VCO driven outputs have programmable output types. They can be programmed to LVPECL, LVDS, or LVCMOS. When all distribution outputs are configured for LVCMOS or single ended LVPECL a total of 24 outputs are available.

If the buffered OSCin output OSCout0 is included in the total number of clock outputs the LMK04906 is able to distribute, then up to 6 differential clocks or up to 12 single ended clocks may be generated with the LMK04906.

The following sections discuss specific features of the clock distribution channels that allow the user to control various aspects of the output clocks.

### CLKout DIVIDER

Each clock output has a single clock output divider. The divider supports a divide range of 1 to 1045 (even and odd) with 50% output duty cycle. When divides of 26 or greater are used, the divider/delay block uses extended mode.

The VCO Divider may be used to reduce the divide needed by the clock output divider so that it may operate in normal mode instead of extended mode. This can result in a small current saving if enabling the VCO Divider allows 3 or more clock output divides to change from extended to normal mode.

### CLKout DELAY

The clock distribution section includes both a fine (analog) and coarse (digital) delay for phase adjustment of the clock outputs.

The fine (analog) delay allows a nominal 25 ps step size and range from 0 to 475 ps of total delay. Enabling the analog delay adds a nominal 500 ps of delay in addition to the programmed value. When adjusting analog delay, glitches may occur on the clock outputs being adjusted. Analog delay may not operate at frequencies above the minimum-guaranteed maximum output frequency of 1536 MHz.

The coarse (digital) delay allows a group of outputs to be delayed by 4.5 to 12 clock distribution path cycles in normal mode, or from 12.5 to 522 VCO cycles in extended mode. The delay step can be as small as half the period of the clock distribution path by using the CLKoutX\_HS bit provided the output divide value is greater than 1. For example 2 GHz VCO frequency without using the VCO divider results in 250 ps coarse tuning steps. The coarse (digital) delay value takes effect on the clock outputs after a SYNC event.

There are 3 different ways to use the digital (coarse) delay.

1. Fixed Digital Delay
2. Absolute Dynamic Digital Delay
3. Relative Dynamic Digital Delay

These are further discussed in the Functional Description.

## PROGRAMMABLE OUTPUT TYPE

For increased flexibility all LMK04906 clock outputs (CLKoutX) and OSCout0 can be programmed to an LVDS, LVPECL, or LVCMOS output type.

Any LVPECL output type can be programmed to 700, 1200, 1600, or 2000 mVpp amplitude levels. The 2000 mVpp LVPECL output type is a Texas Instruments proprietary configuration that produces a 2000 mVpp differential swing for compatibility with many data converters and is also known as 2VPECL.

## CLOCK OUTPUT SYNCHRONIZATION

Using the SYNC input causes all active clock outputs to share a rising edge. See [Clock Output Synchronization \(SYNC\)](#) for more information.

The SYNC event also causes the digital delay values to take effect.

## 0-DELAY

The 0-delay mode synchronizes the input clock phase to the output clock phase. The 0-delay feedback may be performed with an internal feedback loop from some of the clock outputs or with an external feedback loop into the FBCLKin port as selected by the FEEDBACK\_MUX.

Without using 0-delay mode there will be n possible fixed phase relationships from clock input to clock output depending on the clock output divide value.

Using an external 0-delay feedback reduces the number of available clock inputs by one.

## DEFAULT STARTUP CLOCKS

Before the LMK04906 is programmed, CLKout4 is enabled and operating at a nominal frequency and CLKout3 and OSCout0 are enabled and operating at the OSCin frequency. These clocks can be used to clock external devices such as microcontrollers, FPGAs, CPLDs, etc. before the LMK04906 is programmed.

For CLKout3 and OSCout0 to work before the LMK04906 is programmed the device must not be using Crystal mode.

## STATUS PINS

The LMK04906 provides status pins which can be monitored for feedback or in some cases used for input depending upon device programming. For example:

- The Status\_Holdover pin may indicate if the device is in hold-over mode.
- The Status\_CLKin0 pin may indicate the LOS (loss-of-signal) for CLKin0.
- The Status\_CLKin0 pin may be an input for selecting the active clock input.
- The Status\_LD pin may indicate if the device is locked.

The status pins can be programmed to a variety of other outputs including analog lock detect, PLL divider outputs, combined PLL lock detect signals, PLL1 Vtune railing, readback, etc. Refer to the MICROWIRE programming section of this datasheet for more information. Default pin programming is captured in [Table 17](#).

## REGISTER READBACK

Programmed registers may be read back using the MICROWIRE interface. For readback one of the status pins must be programmed for readback mode.

At no time may registers be programed to values other than the valid states defined in the datasheet.

## Functional Description

### FUNCTIONAL OVERVIEW

In default mode of operation, dual PLL mode with internal VCO, the Phase Frequency Detector in PLL1 compares the active CLKinX reference divided by CLKinX\_PreR\_DIV and PLL1 R divider with the external VCXO or crystal attached to the PLL2 OSCin port divided by PLL1 N divider. The external loop filter for PLL1 should be narrow to provide an ultra clean reference clock from the external VCXO or crystal to the OSCin/OSCin\* pins for PLL2.

The Phase Frequency Detector in PLL2 compares the external VCXO or crystal attached to the OSCin port divided by the PLL2 R divider with the output of the internal VCO divided by the PLL2 N divider and N2 pre-scaler and optionally the VCO divider. The bandwidth of the external loop filter for PLL2 should be designed to be wide enough to take advantage of the low in-band phase noise of PLL2 and the low high offset phase noise of the internal VCO. The VCO output is also placed on the distribution path for the clock distribution section. The clock distribution consists of 6 dividers and delays which drive 6 outputs. Each clock output allows the user to select a divide value, a digital delay value, and an analog delay. The 6 dividers drive programmable output buffers. Two outputs allow their input signal to be from the OSCin port directly.

When a 0-delay mode is used, a clock output will be passed through the feedback mux to the PLL1 N Divider for synchronization and 0-delay.

When an external VCO mode is used, the Fin port will be used to input an external VCO signal. PLL2 Phase comparison will now be with this signal divided by the PLL2 N divider and N2 pre-scaler. The VCO divider may not be used. One less clock input is available when using an external VCO mode.

When a single PLL mode is used, PLL1 is powered down. OSCin is used as a reference to PLL2.

### MODE SELECTION

The LMK04906 family is capable of operating in several different modes as programmed by [MODE: Device Mode](#).

**Table 2. Device Mode Selection**

MODE R11[31:27]	PLL1	PLL2	PLL2 VCO	0-delay	Clock Dist
0	X	X	Internal		X
2	X	X	Internal	X	X
3	X	X	External		X
5	X	X	External	X	X
6		X	Internal		X
8		X	Internal	X	X
11		X	External		X
16					X

In addition to selecting the device's mode of operation above, some modes require additional configuration. Also there are other features including holdover and dynamic digital delay that can also be enabled.

**Table 3. Registers to Further Configure Device Mode of Operation**

Register	Holdover	0-Delay	Dynamic Digital Delay
HOLDOVER_MODE	2	—	—
EN_TRACK	User	—	—
DAC_CLK_DIV	User	—	—
EN_MAN_DAC	User	—	—
DISABLE_DLD1_DET	User	—	—
EN_VTUNE_RAIL_DET	User	—	—
DAC_HIGH_TRIP	User	—	—

**Table 3. Registers to Further Configure Device Mode of Operation (continued)**

Register	Holdover	0-Delay	Dynamic Digital Delay
DAC_LOW_TRIP	User	—	—
FORCE_HOLDOVER	0	—	—
SYNC_EN_AUTO	—	—	User
SYNC_QUAL	—	—	1
EN_SYNC	—	—	1
CLKout2_PD	—	—	0
EN_FEEDBACK_MUX	—	1	1
FEEDBACK_MUX	—	Feedback Clock	Qualifying Clock
NO_SYNC_CLKoutX	—	—	User

## INPUTS / OUTPUTS

### PLL1 Reference Inputs (CLKin0, CLKin1, and CLKin2)

The reference clock inputs for PLL1 may be selected from either CLKin0, CLKin1, or CLKin2. The user has the capability to manually select one of the inputs or to configure an automatic switching mode of operation. See [INPUT CLOCK SWITCHING](#) for more info.

CLKin0, CLKin1, and CLKin2 have dividers which allow the device to switch between reference inputs of different frequencies automatically without needing to reprogram the PLL1 R divider. The CLKin pre-divider values are 1, 2, 4, and 8.

CLKin1 input can alternatively be used for external feedback in 0-delay mode (FBCLKin) or for an external VCO input port (Fin).

### PLL2 OSCin / OSCin\* Port

The feedback from the external oscillator being locked with PLL1 drives the OSCin/OSCin\* pins. Internally this signal is routed to the PLL1 N Divider and to the reference input for PLL2.

This input may be driven with either a single-ended or differential signal and must be AC coupled. If operated in single ended mode, the unused input must be connected to GND with a 0.1  $\mu$ F capacitor.

## CRYSTAL OSCILLATOR

The internal circuitry of the OSCin port also supports the optional implementation of a crystal based oscillator circuit. A crystal, a varactor diode, and a small number of other external components may be used to implement the oscillator. The internal oscillator circuit is enabled by setting the EN\_PLL2\_XTAL bit. See [EN\\_PLL2\\_XTAL](#).

## INPUT CLOCK SWITCHING

Manual, pin select, and automatic are three different kinds clock input switching modes can be set with the CLKin\_SELECT\_MODE register.

Below is information about how the active input clock is selected and what causes a switching event in the various clock input selection modes.

### Input Clock Switching - Manual Mode

When CLKin\_SELECT\_MODE is 0, 1, or 2 then CLKin0, CLKin1, or CLKin2 respectively is always selected as the active input clock. Manual mode will also override the EN\_CLKinX bits such that the CLKinX buffer will operate even if CLKinX is disabled with EN\_CLKinX = 0.

### Entering Holdover

If holdover mode is enabled then holdover mode is entered if:

- Digital lock detect of PLL1 goes low and DISABLE\_DLD1\_DET = 0.

## Exiting Holdover

The active clock for automatic exit of holdover mode is the manually selected clock input.

## Input Clock Switching - Pin Select Mode

When CLKIn\_SELECT\_MODE is 3, the pins Status\_CLKIn0 and Status\_CLKIn1 select which clock input is active.

### Clock Switch Event: Pins

Changing the state of Status\_CLKIn0 or Status\_CLKIn1 pins causes an input clock switch event.

### Clock Switch Event: PLL1 DLD

To prevent PLL1 DLD high to low transition from causing a input clock switch event and causing the device to enter holdover mode, disable the PLL1 DLD detect by setting DISABLE\_DLD1\_DET = 1. This is the preferred behavior for Pin Select Mode.

## Configuring Pin Select Mode

The Status\_CLKIn0\_TYPE must be programmed to an input value for the Status\_CLKIn0 pin to function as an input for pin select mode.

The Status\_CLKIn1\_TYPE must be programmed to an input value for the Status\_CLKIn1 pin to function as an input for pin select mode.

If the Status\_CLKInX\_TYPE is set as output, the input value is considered "0."

The polarity of Status\_CLKIn1 and Status\_CLKIn0 input pins can be inverted with the CLKIn\_SEL\_INV bit.

[Table 4](#) defines which input clock is active depending on Status\_CLKIn0 and Status\_CLKIn1 state.

**Table 4. Active Clock Input - Pin Select Mode**

Status_CLKIn1	Status_CLKIn0	Active Clock
0	0	CLKIn0
0	1	CLKIn1
1	0	CLKIn2
1	1	Holdover

The pin select mode will override the EN\_CLKInX bits such that the CLKInX buffer will operate even if CLKInX is disabled with EN\_CLKInX = 0. To switch as fast as possible, keep the clock input buffers enabled (EN\_CLKInX = 1) that could be switched to.

## Pin Select Mode and Host

When in the pin select mode, the host can monitor conditions of the clocking system which could cause the host to switch the active clock input. The LMK04906 device can also provide indicators on the Status\_LD and Status\_HOLD OVER like "DAC Rail," "PLL1 DLD", "PLL1 & PLL2 DLD" which the host can use in determining which clock input to use as active clock input.

## Switch Event without Holdover

When an input clock switch event is triggered and holdover mode is disabled, the active clock input immediately switches to the selected clock. When PLL1 is designed with a narrow loop bandwidth, the switching transient is minimized.

## Switch Event with Holdover

When an input clock switch event is triggered and holdover mode is enabled, the device will enter holdover mode and remain in holdover until a holdover exit condition is met as described in [HOLD OVER MODE](#). Then the device will complete the reference switch to the pin selected clock input.

## Input Clock Switching - Automatic Mode

When CLKIn\_SELECT\_MODE is 4, the active clock is selected in priority order of enabled clock inputs starting upon an input clock switch event. The priority order of the clocks is CLKIn0 → CLKIn1 → CLKIn2, etc.

For a clock input to be eligible to be switched through, it must be enabled using EN\_CLKinX.

### Starting Active Clock

Upon programming this mode, the currently active clock remains active if PLL1 lock detect is high. To ensure a particular clock input is the active clock when starting this mode, program CLKin\_SELECT\_MODE to the manual mode which selects the desired clock input (CLKin0, 1, or 2). Wait for PLL1 to lock PLL1\_DLD = 1, then select this mode with CLKin\_SELECT\_MODE = 4.

### Clock Switch Event: PLL1 DLD

A loss of lock as indicated by PLL1's DLD signal (PLL1\_DLD = 0) will cause an input clock switch event if DISABLE\_DLD1\_DET = 0. PLL1 DLD must go high (PLL1\_DLD = 1) in between input clock switching events.

### Clock Switch Event: PLL1 V<sub>tune</sub> Rail

If Vtune\_RAIL\_DET\_EN is set and the PLL1 Vtune voltage crosses the DAC high or low threshold, holdover mode will be entered. Since PLL1\_DLD = 0 in holdover a clock input switching event will occur.

### Clock Switch Event with Holdover

If holdover is enabled and an input clock switch event occurs, holdover mode is entered and the active clock is set to the next enabled clock input in priority order. When the new active clock meets the holdover exit conditions, holdover is exited and the active clock will continue to be used as a reference until another PLL1 loss of lock event. PLL1 DLD must go high in between input clock switching events.

### Clock Switch Event without Holdover

If holdover is not enabled and an input clock switch event occurs, the active clock is set to the next enabled clock in priority order. The LMK04906 will keep this new input clock as the active clock until another input clock switching event. PLL1 DLD must go high in between input clock switching events.

### Input Clock Switching - Automatic Mode with Pin Select

When CLKin\_SELECT\_MODE is 6, the active clock is selected using the Status\_CLKinX pins upon an input clock switch event according to [Table 5](#).

### Starting Active Clock

Upon programming this mode, the currently active clock remains active if PLL1 lock detect is high. To ensure a particular clock input is the active clock when starting this mode, program CLKin\_SELECT\_MODE to the manual mode which selects the desired clock input (CLKin0 or 1). Wait for PLL1 to lock PLL1\_DLD = 1, then select this mode with CLKin\_SELECT\_MODE = 6.

### Clock Switch Event: PLL1 DLD

An input clock switch event is generated by a loss of lock as indicated by PLL1's DLD signal (PLL1 DLD = 0).

### Clock Switch Event: PLL1 V<sub>tune</sub> Rail

If Vtune\_RAIL\_DET\_EN is set and the PLL1 Vtune voltage crosses the DAC threshold, holdover mode will be entered. Since PLL1\_DLD = 0 in holdover, a clock input switching event will occur.

### Clock Switch Event with Holdover

If holdover is enabled and an input clock switch event occurs, holdover mode is entered and the active clock is set to the clock input defined by the Status\_CLKinX pins. When the new active clock meets the holdover exit conditions, holdover is exited and the active clock will continue to be used as a reference until another input clock switch event. PLL1 DLD must go high in between input clock switching events.

### Clock Switch Event without Holdover

If holdover is not enabled and an input clock switch event occurs, the active clock is set to the clock input defined by the Status\_CLKinX pins. The LMK04906 will keep this new input clock as the active clock until another input clock switching event. PLL1 DLD must go high in between input clock switching events.

**Table 5. Active Clock Input - Auto Pin Mode**

Status_CLKin1	Status_CLKin0	Active Clock
X	1	CLKin0
1	0	CLKin1
0	0	CLKin2

The polarity of Status\_CLKin1 and Status\_CLKin0 input pins can be inverted with the CLKin\_SEL\_INV bit.

## HOLDOVER MODE

Holdover mode causes PLL2 to stay locked on frequency with minimal frequency drift when an input clock reference to PLL1 becomes invalid. While in holdover mode, the PLL1 charge pump is TRI-STATED and a fixed tuning voltage is set on CPout1 to operate PLL1 in open loop.

### Enable holdover

Program [HOLDOVER\\_MODE](#) to enable holdover mode. Holdover mode can be manually enabled by programming the FORCE\_HOLDOVER bit.

The holdover mode can be set to operate in 2 different sub-modes.

- Fixed CPout1 (EN\_TRACK = 0 or 1, EN\_MAN\_DAC = 1).
- Tracked CPout1 (EN\_TRACK = 1, EN\_MAN\_DAC = 0).
  - Not valid when EN\_VTUNE\_RAIL\_DET = 1.

Updates to the DAC value for the Tracked CPout1 sub-mode occurs at the rate of the PLL1 phase detector frequency divided by DAC\_CLK\_DIV. These updates occur any time EN\_TRACK = 1.

The DAC update rate should be programmed for <= 100 kHz to ensure DAC holdover accuracy.

When tracking is enabled the current voltage of DAC can be readback, see [DAC\\_CNT](#).

### Entering holdover

The holdover mode is entered as described in [INPUT CLOCK SWITCHING](#). Typically this is because:

- FORCE\_HOLDOVER bit is set.
- PLL1 loses lock according to PLL1\_DLD, and
  - HOLDOVER\_MODE = 2
  - DISABLE\_DLD1\_DET = 0
- CPout1 voltage crosses DAC high or low threshold, and
  - HOLDOVER\_MODE = 2
  - EN\_VTUNE\_RAIL\_DET = 1
  - EN\_TRACK = 1
  - DAC\_HIGH\_TRIP = User Value
  - DAC\_LOW\_TRIP = User Value
  - EN\_MAN\_DAC = 1
  - MAN\_DAC = User Value

### During holdover

PLL1 is run in open loop mode.

- PLL1 charge pump is set to TRI-STATE.
- PLL1 DLD will be unasserted.
- The HOLDOVER status is asserted
- During holdover If PLL2 was locked prior to entry of holdover mode, PLL2 DLD will continue to be asserted.
- CPout1 voltage will be set to:
  - a voltage set in the MAN\_DAC register (fixed CPout1).
  - a voltage determined to be the last valid CPout1 voltage (tracked CPout1).
- PLL1 DLD will attempt to lock with the active clock input.

The HOLDOVER status signal can be monitored on the Status\_HOLDOVER or Status\_LD pin by programming the HOLDOVER\_MUX or LD\_MUX register to "Holdover Status."

### Exiting holdover

Holdover mode can be exited in one of two ways.

- Manually, by programming the device from the host.
- Automatically, By a clock operating within a specified ppm of the current PLL1 frequency on the active clock input. See [INPUT CLOCK SWITCHING](#) for more detail on which clock input is active.

To exit holdover by programming, set HOLDOVER\_MODE = Disabled. HOLDOVER\_MODE can then be re-enabled by programming HOLDOVER\_MODE = Enabled. Care should be taken to ensure that the active clock upon exiting holdover is as expected, otherwise the CLKIN\_SELECT\_MODE register may need to be re-programmed.

### Holdover Frequency Accuracy and DAC Performance

When in holdover mode PLL1 will run in open loop and the DAC will set the CPout1 voltage. If Fixed CPout1 mode is used, then the output of the DAC will be a voltage dependant upon the MAN\_DAC register. If Tracked CPout1 mode is used, then the output of the DAC will be the voltage at the CPout1 pin before holdover mode was entered. When using Tracked mode and EN\_MAN\_DAC = 1, during holdover the DAC value is loaded with the programmed value in MAN\_DAC, not the tracked value.

When in Tracked CPout1 mode the DAC has a worst case tracking error of  $\pm 2$  LSBs once PLL1 tuning voltage is acquired. The step size is approximately 3.2 mV, therefore the VCXO frequency error during holdover mode caused by the DAC tracking accuracy is  $\pm 6.4 \text{ mV} \times K_v$ . Where  $K_v$  is the tuning sensitivity of the VCXO in use. Therefore the accuracy of the system when in holdover mode in ppm is:

$$\text{Holdover accuracy (ppm)} = \frac{\pm 6.4 \text{ mV} \times K_v \times 1e6}{\text{VCXO Frequency}}$$

Example: consider a system with a 19.2 MHz clock input, a 153.6 MHz VCXO with a  $K_v$  of 17 kHz/V. The accuracy of the system in holdover in ppm is:

$$\pm 0.71 \text{ ppm} = \pm 6.4 \text{ mV} \times 17 \text{ kHz/V} \times 1e6 / 153.6 \text{ MHz}$$

It is important to account for this frequency error when determining the allowable frequency error window to cause holdover mode to exit.

### Holdover Mode - Automatic Exit of Holdover

The LMK04906 device can be programmed to automatically exit holdover mode when the accuracy of the frequency on the active clock input achieves a specified accuracy. The programmable variables include PLL1\_WND\_SIZE and DLD\_HOLD\_CNT.

See [DIGITAL LOCK DETECT FREQUENCY ACCURACY](#) to calculate the register values to cause holdover to automatically exit upon reference signal recovery to within a user specified ppm error of the holdover frequency.

It is possible for the time to exit holdover to vary because the condition for automatic holdover exit is for the reference and feedback signals to have a time/phase error less than a programmable value. Because it is possible for two clock signals to be very close in frequency but not close in phase, it may take a long time for the phases of the clocks to align themselves within the allowable time/phase error before holdover exits.

## PLLs

### PLL1

PLL1's maximum phase detector frequency ( $f_{PD1}$ ) is 40 MHz. Since a narrow loop bandwidth should be used for PLL1, the need to operate at high phase detector rate to lower the in-band phase noise becomes unnecessary. The maximum values for the PLL1 R and N dividers is 16,383. Charge pump current ranges from 100 to 1600  $\mu\text{A}$ . PLL1 N divider may be driven by OSCin port at the OSCout0\_MUX output (default) or by internal or external feedback as selected by Feedback Mux in 0-delay mode.

Low charge pump currents and phase detector frequencies aid design of low loop bandwidth loop filters with reasonably sized components to allow the VCXO or PLL2 to dominate phase noise inside of PLL2 loop bandwidth. High charge pump currents may be used by PLL1 when using VCXOs with leaky tuning voltage inputs to improve system performance.

## PLL2

PLL2's maximum phase detector frequency ( $f_{PD2}$ ) is 155 MHz. Operating at highest possible phase detector rate will ensure low in-band phase noise for PLL2 which in turn produces lower total jitter. The in-band phase noise from the reference input and PLL is proportional to  $N^2$ . The maximum value for the PLL2 R divider is 4,095. The maximum value for the PLL2 N divider is 262,143. The N2 Prescaler in the total N feedback path can be programmed for values 2 to 8 (all divides even and odd). Charge pump current ranges from 100 to 3200  $\mu$ A.

High charge pump currents help to widen the PLL2 loop bandwidth to optimize PLL2 performance.

### PLL2 FREQUENCY DOUBLER

The PLL2 reference input at the OSCin port may be routed through a frequency doubler before the PLL2 R Divider. The frequency doubler feature allows the phase comparison frequency to be increased when a relatively low frequency oscillator is driving the OSCin port. By doubling the PLL2 phase detector frequency, the in-band PLL2 noise is reduced by about 3 dB.

For applications in which the OSCin frequency and PLL2 phase detector frequency are equal, the best PLL2 in-band noise can be achieved when the doubler is enabled ( $EN\_PLL2\_REF\_2X = 1$ ) and the PLL2 R divide value is 2. Do not use doubler disabled ( $EN\_PLL2\_REF\_2X = 0$ ) and PLL2 R divide value of 1.

When using the doubler take care to use the PLL2 R Divider to reduce the phase detector frequency to the limit of the PLL2 maximum phase detector frequency.

### DIGITAL LOCK DETECT

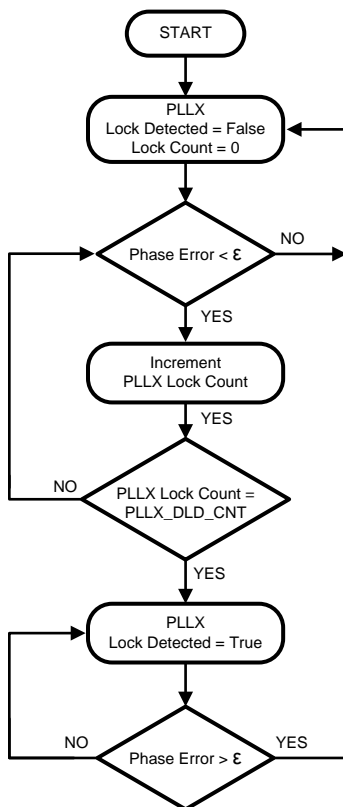

Both PLL1 and PLL2 support digital lock detect. Digital lock detect compares the phase between the reference path (R) and the feedback path (N) of the PLL. When the time error, which is phase error, between the two signals is less than a specified window size ( $\epsilon$ ) a lock detect count increments. When the lock detect count reaches a user specified value lock detect is asserted true. Once digital lock detect is true, a single phase comparison outside the specified window will cause digital lock detect to be asserted false. This is illustrated in [Figure 16](#).

The incremental lock detect count feature functions as a digital filter to ensure that lock detect isn't asserted for only a brief time when the phases of R and N are within the specified tolerance for only a brief time during initial phase lock.

The digital lock detect signal can be monitored on the Status\_LD or Status\_Holdover pin. The pin may be programmed to output the status of lock detect for PLL1, PLL2, or both PLL1 and PLL2.

See [DIGITAL LOCK DETECT FREQUENCY ACCURACY](#) for more detailed information on programming the registers to achieve a specified frequency accuracy in ppm with lock detect.

The digital lock detect feature can also be used with holdover to automatically exit holdover mode. See [HOLDOVER MODE](#) for more info.

**Figure 16. Digital Lock Detect Flowchart**

## STATUS PINS

The Status\_LD, Status\_HOLD OVER, Status\_CLKin0, Status\_CLKin1, and SYNC/Status\_CLKin2 pins can be programmed to output a variety of signals for indicating various statuses like digital lock detect, holdover, several DAC indicators, and several PLL divider outputs.

### Logic Low

This is a very simple output. In combination with the output \_MUX register, this output can be toggled between high and low. Useful to confirm MICROWIRE programming or as a general purpose IO.

### Digital Lock Detect

PLL1 DLD, PLL2 DLD, and PLL1 + PLL2 are selectable on certain output pins. See [DIGITAL LOCK DETECT](#) for more information.

### Holdover Status

Indicates if the device is in Holdover mode. See [HOLD OVER MODE](#) for more information.

### DAC

Various flags for the DAC can be monitored including DAC Locked, DAC Rail, DAC Low, and DAC High.

When the PLL1 tuning voltage crosses the low threshold, DAC Low is asserted. When PLL1 tuning voltage crosses the high threshold, DAC High is asserted. When either DAC Low or DAC High is asserted, DAC Rail will also be asserted.

DAC Locked is asserted when EN\_Track = 1 and DAC is closely tracking the PLL1 tuning voltage.

## PLL Divider Outputs

The PLL divider outputs are useful for debugging failure to lock issues. It allows the user to measure the frequency the PLL inputs are receiving. The settings of PLL1\_R, PLL1\_N, PLL2\_R, and PLL2\_N output pulses at the phase detector rate. The settings of PLL1\_R / 2, PLL1\_N / 2, PLL2\_R / 2, and PLL2\_N / 2 output a 50% duty cycle waveform at half the phase detector rate.

## CLKinX\_LOS

The clock input loss of signal indicator is asserted when LOS is enabled ([EN\\_LOS](#)) and the clock no longer detects an input as defined by the time-out threshold, [LOS\\_TIMEOUT](#).

## CLKinX Selected

If this clock is the currently selected/active clock, this pin will be asserted.

## MICROWIRE Readback

The readback data can be output on any pin programmable to readback mode. For more information on readback see [READBACK](#).

## VCO

The integrated VCO uses a frequency calibration routine when register R30 is programmed to lock VCO to target frequency. Register R30 contains the PLL2\_N register.

During the frequency calibration the PLL2\_N\_CAL value is used instead of PLL2\_N, this allows 0-delay modes to have a separate PLL2 N value for VCO frequency calibration and regular operation.

## CLOCK DISTRIBUTION

### Fixed Digital Delay

This section discussing Fixed Digital delay and associated registers is fundamental to understanding digital delay and dynamic digital delay.

Clock outputs may be delayed or advanced from one another by up to 517.5 clock distribution path periods. By programming a digital delay value from 4.5 to 522 clock distribution path periods, a relative clock output delay from 0 to 517.5 periods is achieved. The CLKoutX\_DDLY (5 to 522) and CLKoutX\_HS (-0.5 or 0) registers set the digital delay as shown in [Table 6](#).

**Table 6. Possible Digital Delay Values**

CLKoutX_DDLY	CLKoutX_HS	Digital Delay
5	1	4.5
5	0	5
6	1	5.5
6	0	6
7	1	6.5
7	0	7
...	...	...
520	0	520
521	1	520.5
521	0	521
522	1	521.5
522	0	522

**Note:** Digital delay values only take effect during a SYNC event and if the NO\_SYNC\_CLKoutX bit is cleared for this clock output. See [Clock Output Synchronization \(SYNC\)](#) for more information.

The resolution of digital delay is determined by the frequency of the clock distribution path. The clock distribution path is the output of Mode Mux1 ([Figure 8](#)). The best resolution of digital delay is achieved by bypassing the VCO divider.

$$\text{Digital Delay Resolution (with VCO Divider)} = \frac{\text{VCO\_DIV}}{2 \times \text{VCO Frequency}} \quad (1)$$

$$\text{Digital Delay Resolution (VCO Divider bypassed or external VCO)} = \frac{1}{2 \times \text{VCO Frequency}} \quad (2)$$

The digital delay between clock outputs can be dynamically adjusted with no or minimum disruption of the output clocks. See [DYNAMICALLY PROGRAMMING DIGITAL DELAY](#) for more information.

### FIXED DIGITAL DELAY - EXAMPLE

Given a VCO frequency of 2457.6 MHz and no VCO divider, by using digital delay the outputs can be adjusted in  $1 / (2 \times 2457.6 \text{ MHz}) = \sim 203.5 \text{ ps}$  steps.

To achieve quadrature (90 degree shift) between the 122.88 MHz outputs on CLKout4 and CLKout3 from a VCO frequency of 2457.6 MHz and bypassing the VCO divider, consider the following:

1. The frequency of 122.88 MHz has a period of  $\sim 8.14 \text{ ns}$ .
2. To delay 90 degrees of a 122.88 MHz clock period requires a  $\sim 2.03 \text{ ns}$  delay.
3. Given a digital delay step of  $\sim 203.5 \text{ ps}$ , this requires a digital delay value of 12 steps ( $2.03 \text{ ns} / 203.5 \text{ ps} = 10$ ).
4. Since the 10 steps are half period steps, CLKout3\_DDLY is programmed 5 full periods beyond 5 for a total of 10.

This result in the following programming:

- Clock output dividers to 20. CLKout2\_DIV = 20 and CLKout3\_DIV = 20.
- Set first clock digital delay value. CLKout2\_DDLY = 5, CLKout2\_HS = 0.
- Set second 90 degree shifted clock digital delay value. CLKout3\_DDLY = 10, CLKout3\_HS = 0.

[Table 7](#) shows some of the possible phase delays in degrees achievable in the above example.

**Table 7. Relative phase shift from  
CLKout2 to CLKout3  
CLKout3\_DDLY = 5 and CLKout3\_HS = 0**

CLKout3_DDLY	CLKout_HS	Relative Digital Delay	Degrees of 122.88 MHz
5	1	-0.5	-9°
5	0	0.0	0°
6	1	0.5	9°
6	0	1.0	18°
7	1	1.5	27°
7	0	2.0	36°
8	1	2.5	45°
8	0	3.0	54°
9	1	3.5	63°
9	0	4.0	72°
10	1	4.5	81°
10	0	5.0	90°
11	1	5.5	99°
11	0	6.0	108°
12	1	6.5	117°
12	0	7.0	126°
13	1	7.5	135°

**Table 7. Relative phase shift from  
CLKout2 to CLKout3  
CLKout3\_DDLY = 5 and CLKout3\_HS = 0 (continued)**

CLKout3_DDLY	CLKout_HS	Relative Digital Delay	Degrees of 122.88 MHz
13	0	8.0	144°
14	1	8.5	153°
...	...	...	...

Figure 18 illustrates clock outputs programmed with different digital delay values during a SYNC event.

Refer to [DYNAMICALLY PROGRAMMING DIGITAL DELAY](#) for more information on dynamically adjusting digital delay.

### Clock Output Synchronization (SYNC)

The purpose of the SYNC function is to synchronize the clock outputs with a fixed and known phase relationship between each clock output selected for SYNC. SYNC can also be used to hold the outputs in a low or 0 state. The NO\_SYNC\_CLKoutX bits can be set to disable synchronization for a clock output.

To enable SYNC, EN\_SYNC must be set. See [EN\\_SYNC, Enable Synchronization](#).

The digital delay value set by CLKoutX\_DDLY takes effect only upon a SYNC event. The digital delay due to CLKoutX\_HS takes effect immediately upon programming. See [DYNAMICALLY PROGRAMMING DIGITAL DELAY](#) for more information on dynamically changing digital delay.

During a SYNC event, clock outputs driven by the VCO are not synchronized to clock outputs driven by OSCin. OSCout0 is always driven by OSCin. CLKout3 or 4 may be driven by OSCin depending on the CLKoutX\_OSCin\_Sel bit value. While SYNC is asserted, NO\_SYNC\_CLKoutX operates normally for CLKout3 and 4 under all circumstances. SYNC operates normally for CLKout3 and 4 when driven by VCO.

### Effect of SYNC

When SYNC is asserted, the outputs to be synchronized are held in a logic low state. When SYNC is unasserted, the clock outputs to be synchronized are activated and will transition to a high state simultaneously with one another except where different digital delay values have been programmed.

Refer to [DYNAMICALLY PROGRAMMING DIGITAL DELAY](#) for SYNC functionality when SYNC\_QUAL = 1.

**Table 8. Steady State Clock Output Condition  
Given Specified Inputs**

SYNC_TYPE	SYNC_POL_INV	SYNC Pin	Clock Output State
0,1,2 (Input)	0	0	Active
0,1,2 (Input)	0	1	Low
0,1,2 (Input)	1	0	Low
0,1,2 (Input)	1	1	Active
3, 4, 5, 6 (Output)	0	0 or 1	Active
3, 4, 5, 6 (Output)	1	0 or 1	Low

### Methods of Generating SYNC

There are five methods to generate a SYNC event:

- Manual:
  - Asserting the SYNC pin according to the polarity set by SYNC\_POL\_INV.
  - Toggling the SYNC\_POL\_INV bit though MICROWIRE will cause a SYNC to be asserted.
- Automatic:
  - If PLL1\_SYNC\_DLD or PLL2\_SYNC\_DLD is set, the SYNC pin will be asserted while DLD (digital lock detect) is false for PLL1 or PLL2 respectively.
  - Programming Register R30, which contains PLL2\_N will generate a SYNC event when using the internal VCO.

- Programming Register R0 through R5 when SYNC\_EN\_AUTO = 1.

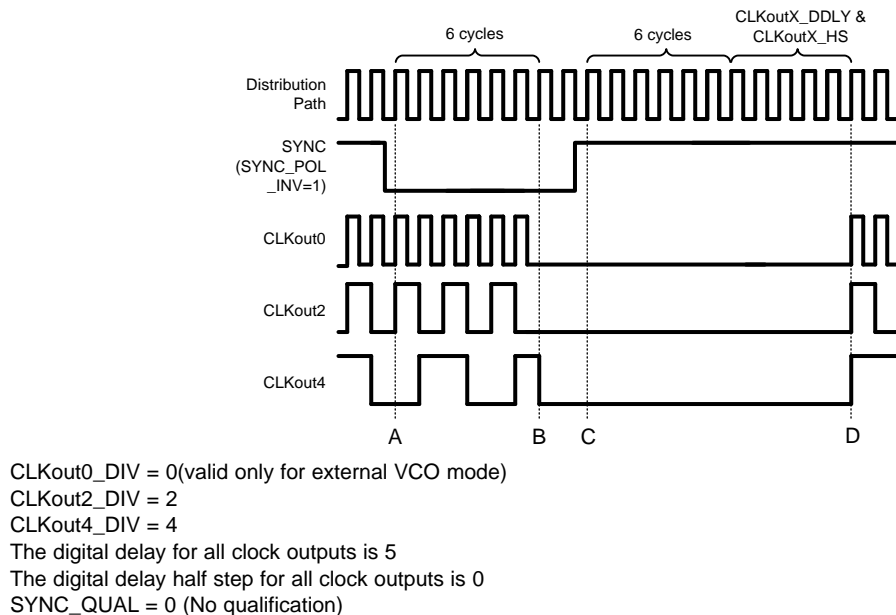

Note: Due to the speed of the clock distribution path (as fast as ~325 ps period) and the slow slew rate of the SYNC, the exact VCO cycle at which the SYNC is asserted or unasserted by the SYNC is undefined. The timing diagrams show a sharp transition of the SYNC to clarify functionality.

### Avoiding clock output interruption due to SYNC

Any CLKout outputs that have their NO\_SYNC\_CLKoutX bits set will be unaffected by the SYNC event. It is possible to perform a SYNC operation with the NO\_SYNC\_CLKoutX bits cleared, then set the NO\_SYNC\_CLKoutX bits so that the selected clocks will not be affected by a future SYNC. Future SYNC events will not effect these clocks but will still cause the newly synchronized clocks to be re-synchronized using the currently programmed digital delay values. When this happens, the phase relationship between the first group of synchronized clocks and the second group of synchronized clocks will be undefined unless the SYNC pulse is qualified by an output clock. See [DYNAMICALLY PROGRAMMING DIGITAL DELAY](#).

### SYNC Timing

When discussing the timing of the SYNC function, one cycle refers to one period of the clock distribution path.

**Figure 17. Clock Output synchronization using the SYNC pin (Active Low)**

Refer to [Figure 17](#) during this discussion on the timing of SYNC. SYNC must be asserted for greater than one clock cycle of the clock distribution path to latch the SYNC event. After SYNC is asserted, the SYNC event is latched on the rising edge of the distribution path clock, at time A. After this event has been latched, the outputs will not reflect the low state for 6 cycles, at time B. Due to the asynchronous nature of SYNC with respect to the output clocks, it is possible that a glitch pulse could be created when the clock output goes low from the SYNC event. This is shown by CLKout4 in [Figure 17](#) and CLKout2 in [Figure 18](#). See [Relative Dynamic Digital Delay](#) for more information on synchronizing relative to an output clock to eliminate or minimize this glitch pulse.

After SYNC becomes unasserted the event is latched on the following rising edge of the distribution path clock, time C. The clock outputs will rise at time D, coincident with a rising distribution clock edge that occurs after 6 cycles plus as many more cycles as programmed by the digital delay for that clock output. Therefore, the soonest a clock output will become high is 11 cycles after the SYNC unassertion event registration, time C, when the smallest digital delay value of 5 is set. If CLKoutX\_HS = 1 and CLKoutX\_DDLY = 5, then the clock output will rise 10.5 cycles after SYNC is unassertion event registration.

**Figure 18. Clock Output synchronization using the SYNC pin (Active Low)**

Figure 18 illustrates the timing with different digital delays programmed.

- Time A) SYNC assertion event is latched.
- Time B) SYNC unassertion latched.
- Time C) All outputs toggle and remain low. A glitch pulse can occur at this time as shown by CLKout2.
- Time D) After  $6 + 4.5 = 10.5$  cycles CLKout0 rises. This is the shortest time from SYNC unassertion registration to clock rising edge possible.
- Time E) After  $6 + 7 = 13$  cycles CLKout2 rises. CLKout2 and CLKout4, 5 are programmed for quadrature operation.
- Time F) After  $6 + 8 = 14$  cycles CLKout4 and 5 rise.

### DYNAMICALLY PROGRAMMING DIGITAL DELAY

To use dynamic digital delay synchronization qualification set SYNC\_QUAL = 1. This causes the SYNC pulse to be qualified by a clock output so that the SYNC event occurs after a specified time from a clock output transition. This allows the relative adjustment of clock output phase in real-time with no or minimum interruption of clock outputs. Hence the term dynamic digital delay.

Note that changing the phase of a clock output requires momentarily altering in the rate of change of the clock output phase and therefore by definition results in a frequency distortion of the signal.

Without qualifying the SYNC with an output clock, the newly synchronized clocks would have a random and unknown digital delay (or phase) with respect to clock outputs not currently being synchronized.

### Absolute vs. Relative Dynamic Digital Delay

The clock used for qualification of SYNC is selected with the feedback mux (FEEDBACK\_MUX).

If the clock selected by the feedback mux has its NO\_SYNC\_CLKoutX = 1, then an **absolute dynamic digital delay** adjustment will be performed during a SYNC event and the digital delay of the feedback clock **will not** be adjusted.

If the clock selected by the feedback mux has its NO\_SYNC\_CLKoutX = 0, then a self-referenced or **relative dynamic digital delay** adjustment will be performed during a SYNC event and the digital delay of the feedback clock **will** be adjusted.

Clocks with NO\_SYNC\_CLKoutX = 1 always operate without interruption.

### Dynamic Digital Delay and 0-Delay Mode

When using a 0-delay mode **absolute** dynamic digital delay is recommended. Using **relative** dynamic digital delay with a 0-delay mode may result in a momentary clock loss on the adjusted clock also being used for 0-delay feedback that may result in PLL1 DLD becoming low. This may result in HOLDOVER mode being activated depending upon device configuration.

### SYNC and Minimum Step Size

The minimum step size adjustment for digital delay is half a clock distribution path cycle. This is achieved by using the CLKoutX\_HS bit. The CLKoutX\_HS bit change effect is immediate without the need for SYNC. To shift digital delay using CLKoutX\_DDLY a SYNC signal must be generated for the change to take effect.

### Programming Overview

To dynamically adjust the digital delay with respect to an existing clock output the device should be programmed as follows:

- Set SYNC\_QUAL = 1 for clock output qualification.
- Set CLKout2\_PD = 0. Required for proper operation of SYNC\_QUAL = 1.
- Set EN\_FEEDBACK\_MUX = 1 to enable the feedback buffer.
- Set FEEDBACK\_MUX to the clock output that the newly synchronized clocks will be qualified by.
- Set NO\_SYNC\_CLKoutX = 1 for the output clocks that will continue to operate during the SYNC event. There is no interruption of output on these clocks.
  - If FEEDBACK\_MUX selects a clock output with NO\_SYNC\_CLKoutX = 1, then **absolute dynamic digital delay** is performed.
  - If FEEDBACK\_MUX selects a clock output with NO\_SYNC\_CLKoutX = 0, then self-referenced or **relative dynamic digital delay** is performed.
- The SYNC\_EN\_AUTO bit may be set to cause a SYNC event to begin when register R0 to R5 is programmed. The auto SYNC feature is a convenience since does not require the application to manually assert SYNC by toggling the SYNC\_POL\_INV bit or the SYNC pin when changing digital delay. However, under the following condition a special programming sequence is required if SYNC\_EN\_AUTO = 1:
  - The CLKoutX\_DDLY value being set in the programmed register is 13 or more.
- Under the following condition a SYNC\_EN\_AUTO must = 0:
  - If the application requires a digital delay resolution of half a clock distribution path cycle in **relative** dynamic digital delay mode because the HS bit must be fixed per [Table 9](#) for a qualifying clock.

### Internal Dynamic Digital Delay Timing

To dynamically adjust digital delay a SYNC must occur. Once the SYNC is qualified by an output clock, 3 cycles later an internal one shot pulse will occur. The width of the one shot pulse is 3 cycles. This internal one shot pulse will cause the outputs to turn off and then back on with a fixed delay with respect to the falling edge of the qualification clock. This allows for dynamic adjustments of digital delay with respect to an output clock.

The qualified SYNC timing is shown in [Figure 19](#) for absolute dynamic digital delay and [Figure 20](#) for relative dynamic digital delay.

### Other Timing Requirements

When adjusting digital delay dynamically, the falling edge of the qualifying clock selected by the FEEDBACK\_MUX must coincide with the falling edge of the clock distribution path. For this requirement to be met, program the CLKoutX\_HS value of the qualifying clock output according to [Table 9](#).

**Table 9. Half Step programming requirement of qualifying clock during SYNC event**

Distribution Path Frequency	CLKoutX_DIV value	CLKoutX_HS
$\geq 1.8$ GHz	Even	Must = 1 during SYNC event.
	Odd	Must = 0 during SYNC event.
$< 1.8$ GHz	Even	Must = 0 during SYNC event.
	Odd	Must = 1 during SYNC event.

**Absolute Dynamic Digital Delay**

Absolute dynamic digital delay can be used to program a clock output to a specific phase offset from another clock output.

Pros:

- Simple direct phase adjustment with respect to another clock output.
- CLKoutX\_HS will remain constant for qualifying clock.
  - Can easily use auto sync feature (SYNC\_EN\_AUTO = 1) when digital delay adjustment requires half step digital delay requirements.
- Can be used with 0-delay mode.

Cons:

- For some phase adjustments there may be a glitch pulse due to SYNC assertion.
  - For example see CLKout4 in [Figure 17](#) and CLKout2 in [Figure 18](#).

**ABSOLUTE DYNAMIC DIGITAL DELAY - EXAMPLE**

To illustrate the absolute dynamic digital delay adjust procedure, consider the following example.

**System Requirements:**

- VCO Frequency = 2457.6 MHz
- CLKout0 = 819.2 MHz (CLKout0\_DIV = 3)
- CLKout2 = 307.2 MHz (CLKout2\_DIV = 8)
- CLKout4 = 245.76 MHz (CLKout4\_DIV = 10)
- For all clock outputs during initial programming:
  - CLKoutX\_DDLY = 5
  - CLKoutX\_HS = 1
  - NO\_SYNC\_CLKoutX = 0

The application requires the 307.2 MHz clock to be stepped in 22.5 degree steps (~203.4 ps), which is the minimum step resolution allowable by the clock distribution path requiring use of the half step bit (CLKoutX\_HS). That is  $1 / 2457.6 \text{ MHz} / 2 = \sim 203.4 \text{ ps}$ . During the stepping of the 307.2 MHz clock the 819.2 MHz and 245.76 MHz clock must not be interrupted.

**Step 1:** The device is programmed from register R0 to R30 with values that result in the device being locked and operating as desired, see the system requirements above. The phase of all the output clocks are aligned because all the digital delay and half step values were the same when the SYNC was generated by programming register R30. The timing of this is as shown in [Figure 17](#).

**Step 2:** Now the registers will be programmed to prepare for changing digital delay (or phase) dynamically.

**Table 10. Register Setup for Absolute Dynamic Digital Delay Example**

Register	Purpose
SYNC_QUAL = 1	Use a clock output for qualifying the SYNC pulse for dynamically adjusting digital delay.
EN_SYNC = 1 (default)	Required for SYNC functionality.
CLKout3_PD = 0	Required when SYNC_QUAL = 1. CLKout3 outputs may be powered down or in use.
EN_FEEDBACK_MUX = 1	Enable the feedback mux for SYNC operation for dynamically adjusting digital delay.

**Table 10. Register Setup for Absolute Dynamic Digital Delay Example (continued)**

Register	Purpose
FEEDBACK_MUX = 2 (CLKout4)	Use the fixed 245.76 MHz clock as the SYNC qualification clock.
NO_SYNC_CLKout0 = 1	This clock output (819.2 MHz) won't be affected by SYNC. It will always operate without interruption.
NO_SYNC_CLKout4 = 1	This clock output (245.76 MHz) won't be affected by SYNC. It will always operate without interruption. This clock will also be the <i>qualifying clock</i> in this example.
CLKout4_HS = 1	Since CLKout4 is the qualifying clock and CLKoutX_DIV is even, the half step bit must be set to 1. See <a href="#">Table 9</a> .
SYNC_EN_AUTO = 1	Automatic generation of SYNC is allowed for this case.

After the registers in [Table 10](#) have been programmed, the application may now dynamically adjust the digital delay of CLKout2 (307.2 MHz).

### Step 3: Adjust digital delay of CLKout2.

Refer to [Table 11](#) for the programming values to set a specified phase offset from the absolute reference clock. [Table 11](#) is dependant upon the qualifying clock divide value of 12, refer to [CALCULATING DYNAMIC DIGITAL DELAY VALUES FOR ANY DIVIDE](#) for information on creating tables for any divide value.

**Table 11. Programming for Absolute Digital Delay Adjustment**

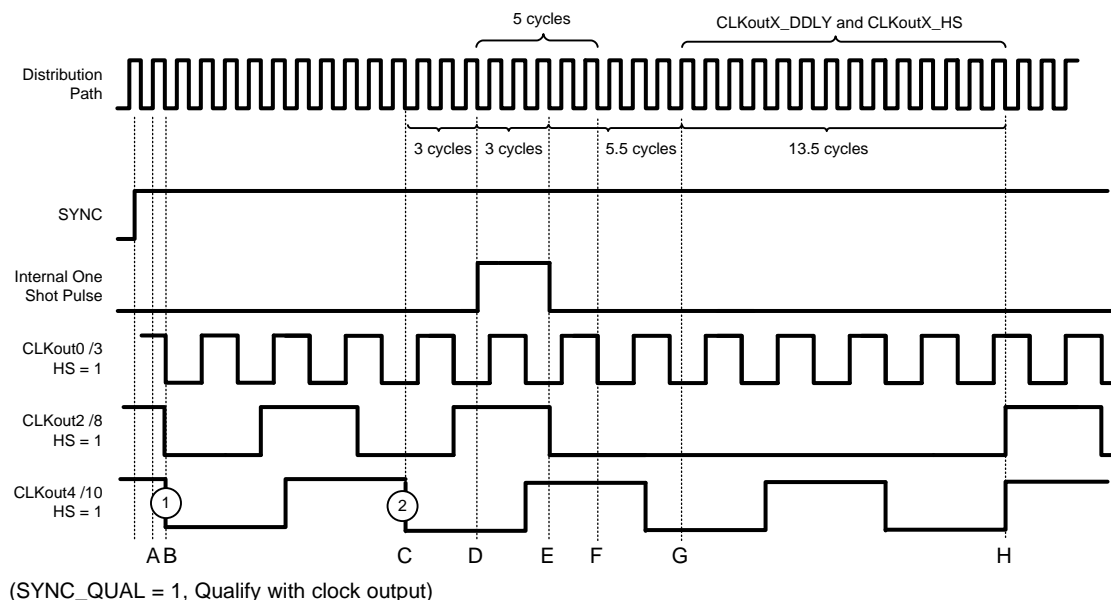

Degrees of Adjustment from initial 307.2MHz phase		Programming
+/-0 or +/-360 degrees		CLKout2_DDLY = 14; CLKout2_HS = 1
22.5 degrees	-337.5 degrees	CLKout2_DDLY = 14; CLKout2_HS = 0
45 degrees	-315 degrees	CLKout2_DDLY = 15; CLKout2_HS = 1
67.5 degrees	-292.54 degrees	CLKout2_DDLY = 5; CLKout2_HS = 0
90 degrees	-270 degrees	CLKout2_DDLY = 6; CLKout2_HS = 1
112.5 degrees	-247.5 degrees	CLKout2_DDLY = 6; CLKout2_HS = 0
135 degrees	-25 degrees	CLKout2_DDLY = 7; CLKout2_HS = 1
157.5 degrees	-202.5 degrees	CLKout2_DDLY = 7; CLKout2_HS = 0
180 degrees	-180 degrees	CLKout2_DDLY = 8; CLKout2_HS = 1
247.5 degrees	-112.5 degrees	CLKout2_DDLY = 8; CLKout2_HS = 0
270 degrees	-90 degrees	CLKout2_DDLY = 9; CLKout2_HS = 1
292.5 degrees	-67.5 degrees	CLKout2_DDLY = 9; CLKout2_HS = 0
315 degrees	-45 degrees	CLKout2_DDLY = 10; CLKout2_HS = 1
337.5 degrees	-22.5 degrees	CLKout2_DDLY = 10; CLKout2_HS = 0

After setting the new digital delay values, the act of programming R1 will start a SYNC automatically because SYNC\_EN\_AUTO = 1.

If the user elects to reduce the number of SYNCs because they are not required when only CLKout2\_HS is set, then SYNC\_EN\_AUTO is = 0 and the SYNC may now be generated by toggling the SYNC pin or by toggling the SYNC\_POL\_INV bit. Because of the internal one shot pulse, no strict timing of the SYNC pin or SYNC\_POL\_INV bit is required.

After the SYNC event, the clock output will adjust according to [Table 11](#). See [Figure 19](#) for a detailed view of the timing diagram. The timing diagram critical points are:

- Time A) SYNC assertion event is latched.
- Time B) First qualifying falling clock output edge.
- Time C) Second qualifying falling clock output edge.
- Time D) Internal one shot pulse begins. 5 cycles later clock outputs will be forced low
- Time E) Internal one shot pulse ends. 5 cycles + digital delay cycles later the synced clock outputs rise.
- Time F) Clock outputs are forced low. (CLKout2 is already low).
- Time G) Beginning of digital delay cycles.
- Time H) For CLKout2\_DDLY = 14; the clock output rises now.

**Figure 19. Absolute Dynamic Digital Delay Programming Example**

### Relative Dynamic Digital Delay

Relative dynamic digital delay can be used to program a clock output to a specific phase offset from another clock output.

Pros:

- Simple direct phase adjustment with respect to same clock output.
- The clock output will always behave the same during digital delay adjustment transient. For some divide values there will be no glitch pulse.

Cons:

- For some clock divide values there may be a glitch pulse due to SYNC assertion.
- Adjustments of digital delay requiring the half step bit (CLKoutX\_HS) for finer digital delay adjust is complicated.
- Use with 0-delay mode may result in PLL1 DLD becoming low and HOLDOVER mode becoming activated.
  - DISABLE\_DLD1\_DET can be set to prevent HOLDOVER from becoming activated due to PLL1 DLD becoming low.

### RELATIVE DYNAMIC DIGITAL DELAY - EXAMPLE

To illustrate the relative dynamic digital delay adjust procedure, consider the following example.

#### System Requirements:

- VCO Frequency = 2457.6 MHz
- CLKout0 = 819.2 MHz (CLKout0\_DIV = 3)
- CLKout2 = 491.52 MHz (CLKout2\_DIV = 5)
- CLKout4 = 491.52 MHz (CLKout4\_DIV = 5)
- For all clock outputs during initial programming:
  - CLKoutX\_DDLY = 5
  - CLKoutX\_HS = 0
  - NO\_SYNC\_CLKoutX = 0

The application requires the 491.52 MHz clock to be stepped in 22.5degree steps (~203.4 ps), which is the minimum step resolution allowable by the clock distribution path. That is  $1 / 2457.62 \text{ MHz} / 2 = \sim 203.4 \text{ ps}$ . During the stepping of the 491.52 MHz clocks the 819.2 MHz clock must not be interrupted.

**Step 1:** The device is programmed from register R0 to R30 with values that result in the device being locked and operating as desired, see the system requirements above. The phase of all the output clocks are aligned because all the digital delay and half step values were the same when the SYNC was generated by programming register R30. The timing of this is as shown in [Figure 17](#).

**Step 2:** Now the registers will be programmed to prepare for changing digital delay (or phase) dynamically.

Register	Purpose
SYNC_QUAL = 1	Use clock output for qualifying the SYNC pulse for dynamically adjusting digital delay.
EN_SYNC = 1 (default)	Required for SYNC functionality.
CLKout3_PD = 0	Required when SYNC_QUAL = 1. CLKout3 outputs may be powered down or in use.
EN_FEEDBACK_MUX = 1	Enable the feedback mux for SYNC operation for dynamically adjusting digital delay.
FEEDBACK_MUX = 1 (CLKout2)	Use the clock itself as the SYNC qualification clock.
NO_SYNC_CLKout0 = 1	This clock output (819.2 MHz) won't be affected by SYNC. It will always operate without interruption.
NO_SYNC_CLKout4 = 1	CLKout4's phase is not to change with respect to CLKout0.
SYNC_EN_AUTO = 0 (default)	Automatic generation of SYNC is not allowed because of the half step requirement in relative dynamic digital delay mode. SYNC must be generated manually by toggling the SYNC_POL_INV bit or the SYNC pin.

After the above registers have been programmed, the application may now dynamically adjust the digital delay of the 491.52 MHz clocks.

**Step 3:** Adjust digital delay of CLKout2 by one step which is 22.5 degrees or ~203.4 ps.

Refer to [Table 12](#) for the programming sequence to step one half clock distribution period forward or backwards. Refer to [CALCULATING DYNAMIC DIGITAL DELAY VALUES FOR ANY DIVIDE](#) for more information on how to calculate digital delay and half step values for other cases.

To fulfill the qualifying clock output half step requirement in [Table 9](#) when dynamically adjusting digital delay, the CLKoutX\_HS bit must be cleared for clocks with even divides. So before any dynamic digital delay adjustment, CLKoutX\_HS must be clear because the clock divide value is even. To achieve the final required digital delay adjustment, the CLKoutX\_HS bit may set after SYNC.

**Table 12. Programming sequence for one step adjust**

Step direction and current HS state	Programming Sequence
Adjust clock output one step forward. CLKout2_HS is 0.	1. CLKout2_HS = 1.
Adjust clock output one step forward. CLKout2_HS is 1.	1. CLKout2_DDLY = 11. 2. Perform SYNC event. 3. CLKout2_HS = 0.
Adjust clock output one step backward. CLKout2_HS is 0.	1. CLKout2_HS = 1. 2. CLKout2_DDLY = 11. 3. Perform SYNC event.
Adjust clock output one step backward. CLKout2_HS is 1.	1. CLKout2_HS = 0.

After programming the updated CLKout2\_DDLY and CLKout2\_HS values, perform a SYNC event. The SYNC may be generated by toggling the SYNC pin or by toggling the SYNC\_POL\_INV bit. Because of the internal one shot pulse, no strict timing of the SYNC pin or SYNC\_POL\_INV bit is required. After the SYNC event, the clock output will be at the specified phase. See [Figure 20](#) for a detailed view of the timing diagram. The timing diagram critical points are:

- Time A) SYNC assertion event is latched.
- Time B) First qualifying falling clock output edge.
- Time C) Second qualifying falling clock output edge.

- Time D) Internal one shot pulse begins. 5 cycles later clock outputs will be forced low.
- Time E) Internal one shot pulse ends. 5 cycles + digital delay cycles later the synced clock outputs rise.
- Time F) Clock outputs are forced low. (CLKouts are already low).
- Time G) Beginning of digital delay cycles.
- Time H) For CLKout2\_DDLY = 11; the clock output rises now.

**Figure 20. Relative Dynamic Digital Delay Programming Example—2nd adjust**

### 0-Delay Mode

When 0-delay mode is enabled the clock output selected by the Feedback Mux is connected to the PLL1 N counter to ensure a fixed phase relationship between the selected CLKin and the fed back CLKout. When all the clock outputs are synced together, all the clock outputs will share the same fixed phase relationship between the selected CLKin and the fed back CLKout. The feedback can be internal or external using FBCLKin port.

When 0-delay mode is enabled the lowest frequency clock output is fed back to the Feedback Mux to ensure a repeatable fixed CLKin to CLKout phase relationship between all clock outputs.

If a clock output that is not the lowest frequency output is selected for feedback, then clocks with lower frequencies will have an unknown phase relationship with respect the other clocks and clock input. There will be a number of possible phase relationships equal to  $\text{Feedback\_Clock\_Frequency} / \text{Lower\_Clock\_Frequency}$  that may occur.

The Feedback Mux can select a clock output of some of the clocks for internal feedback or the FBCLKin port for external 0-delay feedback.

To use 0-delay mode, the bit EN\_FEEDBACK\_MUX must be set (=1) to power up the feedback mux.

See [PLL PROGRAMMING](#) for more information on programming PLL1\_N for 0-delay mode.

When using an external VCO mode, internal 0-delay feedback must be used since the FBCLKin port is shared with the Fin input.

[Table 13](#) outlines several registers to program for 0-delay mode.

**Table 13. Programming 0-Delay Mode**

Register	Purpose
MODE = 2 or 5	Select one of the 0-delay modes for device.
EN_FEEDBACK_MUX = 1	Enable feedback mux.

**Table 13. Programming 0-Delay Mode (continued)**

Register	Purpose
FEEDBACK_MUX = Application Specific	Select CLKout or FBCLKin for 0-delay feedback.
CLKoutX_DIV	The divide value of the clock selected by FEEDBACK_MUX is important for PLL2 N value calculation
PLL1_N	PLL1_N value used with CLKoutX_DIV in loop.

## General Programming Information

LMK04906 devices are programmed using 32-bit registers. Each register consists of a 5-bit address field and 27-bit data field. The address field is formed by bits 0 through 4 (LSBs) and the data field is formed by bits 5 through 31 (MSBs). The contents of each register is clocked in MSB first (bit 31), and the LSB (bit 0) last. During programming, the LLeWire signal should be held *low*. The serial data is clocked in on the rising edge of the CLKuWire signal. After the LSB (bit 0) is clocked in the LLeWire signal should be toggled *low-to-high-to-low* to latch the contents into the register selected in the address field. It is recommended to program registers in numeric order, for example R0 to R16, and R24 to R31 to achieve proper device operation. [Figure 10](#) illustrates the serial data timing sequence.

To achieve proper frequency calibration, the OSCin port must be driven with a valid signal before programming register R30. Changes to PLL2 R divider or the OSCin port frequency require register R30 to be reloaded in order to activate the frequency calibration process.

### SPECIAL PROGRAMMING CASE FOR R0 to R5 for CLKoutX\_DIV & CLKoutX\_DDLy

In some cases when programming register R0 to R5 to change the CLKoutX\_DIV divide value or CLKoutX\_DDLy delay value, 3 additional CLKuWire cycles must occur after loading the register for the newly programmed divide or delay value to take effect. These special cases include:

- When CLKoutX\_DIV is > 25.
- When CLKoutX\_DDLy is > 12. Note, loading the digital delay value only prepares for a future SYNC event.

Also, since SYNC\_EN\_AUTO bit = 1 automatically generates a SYNC on the falling edge of LE when R0 to R5 is programmed, further programming considerations must be made when SYNC\_EN\_AUTO = 1.

These special programming cases requiring the additional three clock cycles may be properly programmed by one of the following methods shown in [Table 14](#).

**Table 14. R0 to R5 Special Case**

CLKoutX_DIV & CLKoutX_DDLy	SYNC_EN_AUTO	Programming Method
CLKoutX_DIV ≤ 25 and CLKoutX_DDLy ≤ 12	0 or 1	No Additional Clocks Required (Normal)
CLKoutX_DIV > 25 or CLKoutX_DDLy > 12	0	Three Extra CLKuWire Clocks (Or program another register)
CLKoutX_DIV > 25 or CLKoutX_DDLy > 12	1	Three Extra CLKuWire Clocks while LLeWire is High

#### Method: No Additional Clocks Required (Normal)

No special consideration to CLKuWire is required when changing divide value to ≤ 25, digital delay value to ≤ 12, or when the digital delay and divide value do not change. See MICROWIRE timing [Figure 10](#).

#### Method: Three Extra CLKuWire Clocks

Three extra clocks must be provided before CLKoutX\_DIV > 25 or CLKoutX\_DDLy > 12 take effect. See MICROWIRE timing [Figure 11](#).

Also, by programming another register the three clock requirement can be satisfied.

#### Method: Three Extra CLKuWire Clocks with LLeWire Asserted

When SYNC\_EN\_AUTO = 1 the falling edge of LEuWire will generate a SYNC event. CLKoutX\_DIV and CLKoutX\_DDLY values must be updated before the SYNC event occurs. So 3 CLKuWire rising edges must occur before LEuWire goes low. See MICROWIRE timing [Figure 12](#).

### Initial Programming Sequence

During the recommended programming sequence the device is programmed in order from R0 to R31, so it is expected at least one additional register will be programmed after programming the last CLKoutX\_DIV or CLKoutX\_DDLY value in R0 to R5. This will result in the extra needed CLKuWire rising edges, so this special note is of little concern.

If programming R0 to R5 to change CLKout frequency or digital delay or dynamic digital delay at a later time in the application, care must be taken to provide these extra CLKuWire cycles to properly load the new divide and/or delay values.

### Example

In this example, all registers have been programmed, the PLLs are locked. An LMK04906 has been generating a clock output frequency of 61.44 MHz on CLKout4 using a VCO frequency of 2457.6 MHz and a divide value of 40. SYNC\_EN\_AUTO = 0. At a later time the application requires a 30.72 MHz output on CLKout4. By reprogramming register R4 with CLKout4\_DIV = 80 twice, the divide value of 80 is set for clock output 4 which results in an output frequency of 30.72 MHz ( $2457.6 \text{ MHz} / 80 = 30.72 \text{ MHz}$ ) on CLKout4.

In this example the required 3 CLKuWire cycles were achieved by reprogramming the R4 register with the same value twice.

### RECOMMENDED PROGRAMMING SEQUENCE

Registers are programmed in numeric order with R0 being the first and R31 being the last register programmed. The recommended programming sequence involves programming R0 with the reset bit (b17) set to 1 to ensure the device is in a default state. If R0 is programmed again, the reset bit must be cleared to 0 during the programming of R0.

### Overview

- Program R0 with RESET bit = 1. This ensures that the device is configured with default settings. When RESET = 1, all other R0 bits are ignored.
  - If R0 is programmed again during the initial configuration of the device, the RESET bit must be cleared.
- R0 through R5: CLKouts.
  - Program as necessary to configure the clock outputs, CLKout0 to CLKout5 as desired. These registers configure clock output controls such as powerdown, digital delay and divider value, analog delay select, and clock source select.
- R6 through R8: CLKouts.
  - Program as necessary to configure the clock outputs, CLKout0 to CLKout5 as desired. These registers configure the output format for each clock outputs and the analog delay for the clock outputs.
- R9: Required programming
  - Program this register as shown in the register map for proper operation.
- R10: OSCouts, VCO divider, and 0-delay.
  - Enable and configure clock outputs OSCout0/1.
  - Set and select VCO divider (VCO bypass is recommended).
  - Set 0-delay feedback source if used.
- R11: Part mode, SYNC, and XTAL.
  - Program to configure the mode of the part, to configure SYNC functionality and pin, and to enable crystal mode.
- R12: Pins, SYNC, and holdover mode.
  - Status\_LD pin, more SYNC options to generate a SYNC upon PLL1 and/or PLL2 lock detect.
  - Enable clock features such as holdover.
- R13: Pins, holdover mode, and CLKins.
  - Status\_HOLD OVER, Status\_CLKin0, and Status\_CLKin1 pin controls.

- Enable clock inputs for use in specific part modes.
- R14: Pins, LOS, CLKins, and DAC.
  - Status\_CLKin1 pin control.
  - Loss of signal detection, CLKin type, DAC rail detect enable and high and low trip points.
- R15: DAC and holdover mode.
  - Program to enable and set the manual DAC value.
  - HOLDOVER mode options.
- R16: Crystal amplitude.
  - Increasing XTAL\_LVL can improve tunable crystal phase noise performance.
- R24: PLL1 and PLL2.
  - PLL1 N and R delay and PLL1 digital lock delay value.
  - PLL2 integrated loop filter.
- R25: DAC and PLL1.
  - Program to configure DAC update clock divider and PLL1 digital lock detect count.
- R26: PLL2.
  - Program to configure PLL2 options.
- R27: CLKins and PLL1.
  - Clock input pre-dividers.
  - Program to configure PLL1 options.
- R28: PLL1 and PLL2.
  - Program to configure PLL2 R and PLL1 N.
- R29: OSCin and PLL2.
  - Program to configure oscillator input frequency, PLL2 fast phase detector frequency mode, and PLL2 N calibration value.
- R30: PLL2.
  - Program to configure PLL2 prescaler and PLL2 N value.
- R31: uWire lock.
  - Program to set the uWire\_LOCK bit.

## READBACK

At no time should the MICROWIRE registers be programmed to any value other than what is specified in the datasheet.

For debug of the MICROWIRE interface, it is recommended to simply program an output pin mux to active low and then toggle the output type register between output and inverting output while observing the output pin for a low to high transition. For example, to verify MICROWIRE programming, set the LD\_MUX = 0 (Low) and then toggle the LD\_TYPE register between 3 (Output, push-pull) and 4 (Output inverted, push-pull). The result will be that the Status\_LD pin will toggle from low to high.

Readback from the MICROWIRE programming registers is available. The MICROWIRE readback function can be enabled on the Status\_LD, Status\_HOLDOVER, Status\_CLKin0, Status\_CLKin1, or SYNC pin by programming the corresponding MUX register to “uWire Readback” and the corresponding TYPE register to “Output (push-pull).” Power on reset defaults the Status\_HOLDOVER pin to “uWire Readback.”

**Figure 13** illustrates the serial data timing sequence for a readback operation for both cases of READBACK\_LE = 0 (POR default) and READBACK\_LE = 1.

To perform a readback operation first set the register to be read back by programming the READBACK\_ADDR register. Then after any MICROWIRE write operation, with the LEuWire pin held low continue to clock the CLKuWire pin. On every rising edge of the CLKuWire pin a new data bit is clocked onto the any pins programmed for uWire Readback. If the READBACK\_LE bit is set, the LEuWire pin should be left high after LEuWire rising edge while continuing to clock the CLKuWire pin.

It is allowable to perform a register read back in the same MICROWIRE operation which set the READBACK\_ADDR register value.

Data is clocked out MSB first. After 27 clocks all the data values will have been read and the read operation is complete. If READBACK\_LE = 1, the LEuWire line may now be lowered. It is allowable for the CLKuWire pin to be clocked additional cycles, but the data on the readback pin will be invalid.

CLKuWire must be low before the falling edge of LEuWire.

### Readback - Example

To readback register R3 perform the following steps:

- Write R31 with READBACK\_ADDR = 3; READBACK\_LE = 0. DATAuWire and CLKuWire are toggled as shown in [Figure 10](#) with new data being clocked in on rising edges of CLKuWire
- Toggle LEuWire high and then low as shown in [Figure 10](#) and [Figure 13](#). LEuWire is returned low because READBACK\_LE = 0.
- Toggle CLKuWire high and then low 27 times to read back all 27 bits of register R3. Data is read MSB first. Data is valid on falling edge of CLKuWire.
- Read operation is complete.

### REGISTER MAP AND READBACK REGISTER MAP

[Table 15](#) provides the register map for device programming. Normally any register can be read from the same data address it is written to. However, READBACK\_LE has a **different readback address**. Also, the DAC\_CNT register is a read only register. [Table 16](#) shows the address for READBACK\_LE and DAC\_CNT. Bits marked as reserved are undefined upon readback.

Observe that only the DATA bits are readback during a readback which can result in an offset of 5 bits between the two register tables.

## DEFAULT DEVICE REGISTER SETTINGS AFTER POWER ON RESET

Table 17 illustrates the default register settings programmed in silicon for the LMK04906 after power on or asserting the reset bit. Capital X and Y represent numeric values.

**Table 17. Default Device Register Settings after Power On/Reset**

Group	Field Name	Default Value (decimal)	Default State	Field Description	Register	Bit Location (MSB:LSB)
Clock Output Control	CLKout0_PD	1	PD	Powerdown control for analog and digital delay, divider, and both output buffers	R0	31
	CLKout1_PD	1	PD		R1	
	CLKout2_PD	1	PD		R2	
	CLKout3_PD	0	Normal		R3	
	CLKout4_PD	0	Normal		R4	
	CLKout5_PD	1	PD		R5	
	CLKout3_OSCin_Sel	1	OSCin	Selects the clock source for a clock output from internal VCO or external OSCin	R3	30
	CLKout4_OSCin_Sel	0	VCO		R4	30
	CLKoutX_ADLY_SEL	0	None	Add analog delay for clock output	R0 to R5	28, 29
	CLKoutX_DDLTY	0	5	Digital delay value	R0 to R5	27:18 [10]
	RESET	0	Not in reset	Performs power on reset for device	R0	17
	POWERDOWN	0	Disabled (device is active)	Device power down control	R1	17
	CLKoutX_HS	0	No shift	Half shift for digital delay	R0 to R5	16
	CLKout0_DIV	25	Divide-by-25	Divide for clock outputs	R0	15:5 [11]
	CLKout1_DIV	25	Divide-by-25		R1	
	CLKout2_DIV	25	Divide-by-25		R2	
	CLKout3_DIV	1	Divide-by-1		R3	
	CLKout4_DIV	25	Divide-by-25		R4	
	CLKout5_DIV	25	Divide-by-25		R5	
	CLKout1_TYPE	0	Powerdown	Individual clock output format. Select from LVDS/LVPECL/LVCMOS.	R6	27:24 [4]
	CLKout3_TYPE	8	LVCMOS (Norm/Norm)		R7	
	CLKout5_TYPE	0	Powerdown		R8	
	CLKout0_TYPE	0	Powerdown		R6	23:20 [4]
	CLKout2_TYPE	0	Powerdown		R7	
	CLKout4_TYPE	1	LVDS		R8	19:16 [4]
	CLKoutX_ADLY	0	No delay	Analog delay setting for clock output	R6 to R8	15:11, 9:5 [5]
	OSCOut0_TYPE	1	LVDS	OSCOut0 default clock output	R10	27:24 [4]
	EN_OSCOut0	1	Enabled	Enable OSCOut0 output buffer	R10	22
	OSCOut0_MUX	0	Bypass Divider	Select OSCOut divider for OSCOut0 or bypass	R10	20
	PD_OSCin	0	OSCin powered	Allows OSCin to be powered down. For use in clock distribution mode.	R10	19
	OSCOut_DIV	0	Divide-by-8	OSCOut divider value	R10	18:16 [3]

**Table 17. Default Device Register Settings after Power On/Reset (continued)**

Group	Field Name	Default Value (decimal)	Default State	Field Description	Register	Bit Location (MSB:LSB)
Mode	VCO_MUX	0	VCO	Select VCO or VCO Divider output	R10	12
	EN_FEEDBACK_MUX	0	Disabled	Feedback MUX is powered down.	R10	11
	VCO_DIV	2	Divide-by-2	VCO Divide value	R10	10:8 [3]
	FEEDBACK_MUX	0	CLKout0	Selects CLKout to feedback into the PLL1 N divider	R10	7:5 [3]
	MODE	0	Internal VCO	Device mode	R11	31:27 [5]
Clock Synchronization	EN_SYNC	1	Enabled	Enables synchronization circuitry.	R11	26
	NO_SYNC_CLKout5	0	Will sync	Disable individual clock output from becoming synchronized.	R11	25
	NO_SYNC_CLKout4	1	Will not sync		R11	24
	NO_SYNC_CLKout3	1	Will not sync		R11	23

	PLL2_N_CAL	48	Divide-by-48	Must be programmed to PLL2_N value.	R29	22:5 [18]
	PLL2_P	2	Divide-by-2	PLL2 N Divider Prescaler (2 to 8)	R30	26:24 [3]
	PLL2_N	48	Divide-by-48	PLL2 N Divider (1 to 262143)	R30	22:5 [18]

(1) This register must be reprogrammed to a value of 2 (3.7 ns) during user programming.

**Table 17. Default Device Register Settings after Power On/Reset (continued)**

Group	Field Name	Default Value (decimal)	Default State	Field Description	Register	Bit Location (MSB:LSB)
	READBACK_LE	0	LEuWire Low for Readback	State LEuWire pin must be in for readback	R31	21
	READBACK_A DDR	31	Register 31	Register to read back	R31	20:16 [5]
	uWire_LOCK	0	Writable	The values of registers R0 to R30 are lockable	R31	5

## REGISTER R0 TO R5

Registers R0 through R5 control the 6 clock outputs CLKout0 to CLKout5. Register R0 controls CLKout0, Register R1 controls CLKout1, and so on. All functions of the bits in these six registers are identical except the different registers control different clock outputs. The X in CLKoutX\_PD, CLKoutX\_ADLY\_SEL, CLKoutX\_DDLY, CLKoutX\_HS, CLKoutX\_DIV denote the actual clock output which may be from 0 to 5.

The RESET bit is only in register R0.

The POWERDOWN bit is only in register R1.

The CLKoutX\_OSCin\_Sel bit is only in registers R3 and R4.

### **CLKoutX\_PD, Powerdown CLKoutX Output Path**

This bit powers down the clock output as specified by CLKoutX. This includes the divider, digital delay, analog delay, and output buffers.

**Table 18. CLKoutX\_PD**

R0-R5[31]	State
0	Power up clock output
1	Power down clock output

### **CLKoutX\_OSCin\_Sel, Clock output source**

This bit sets the source for the clock CLKoutX. The selected source will be either from a VCO via Mode Mux1 or from the OSCin buffer.

This bit is valid only for registers R3 and R4, clock outputs CLKout3 and CLKout4 respectively. All other clock outputs are driven by a VCO via Mode Mux1.

**Table 19. CLKoutX\_OSCin\_Sel**

R3-R4[30]	Clock output source
0	VCO
1	OSCin

### **CLKoutX\_ADLY\_SEL[29], CLKoutX\_ADLY\_SEL[28], Select Analog Delay**

These bits individually select the analog delay block ([CLKoutX\\_ADLY](#)) for use with CLKoutX. If a clock output does not use analog delay, the analog delay block is powered down.

**Table 20. CLKoutX\_ADLY\_SEL[29], CLKoutX\_ADLY\_SEL[28]**

R0-R5[28],[29]	State
0	Analog delay powered down
1	Analog delay on CLKoutX

### CLKoutX\_DDLY, Clock Channel Digital Delay

CLKoutX\_DDLY and CLKoutX\_HS sets the digital delay used for CLKoutX. This value only takes effect during a SYNC event and if the NO\_SYNC\_CLKoutX bit is cleared for this clock output. See [Clock Output Synchronization \(SYNC\)](#).

Programming CLKoutX\_DDLY can require special attention. See section [SPECIAL PROGRAMMING CASE FOR R0 to R5 for CLKoutX\\_DIV & CLKoutX\\_DDLY](#) for more details.

Using a CLKoutX\_DDLY value of 13 or greater will cause the clock output to operate in extended mode regardless of the clock output's divide value or the half step value.

One clock cycle is equal to the period of the clock distribution path. The period of the clock distribution path is equal to VCO Divider value divided by the frequency of the VCO. If the VCO divider is disabled or an external VCO is used, the VCO divide value is treated as 1.

$$t_{\text{clock distribution path}} = \text{VCO divide value} / f_{\text{VCO}}$$

**Table 21. CLKoutX\_DDLY, 10 bits**

R0-R5[27:18]	Delay	Power Mode
0 (0x00)	5 clock cycles	Normal Mode
1 (0x01)	5 clock cycles	
2 (0x02)	5 clock cycles	
3 (0x03)	5 clock cycles	
4 (0x04)	5 clock cycles	
5 (0x05)	5 clock cycles	
6 (0x06)	6 clock cycles	
7 (0x07)	7 clock cycles	
...	...	
12 (0x0C)	12 clock cycles	
13 (0x0D)	13 clock cycles	Extended Mode
...	...	
520 (0x208)	520 clock cycles	
521 (0x209)	521 clock cycles	
522 (0x20A)	522 clock cycles	

### RESET

The RESET bit is located in register R0 only. Setting this bit will cause the silicon default values to be loaded. When programming register R0 with the RESET bit set, all other programmed values are ignored. After resetting the device, the register R0 must be programmed again (with RESET = 0) to set non-default values in register R0.

The reset occurs on the falling edge of the LEuWire pin which loaded R0 with RESET = 1.

The RESET bit is automatically cleared upon writing any other register. For instance, when R0 is written to again with default values.

**Table 22. RESET**

R0[17]	State
0	Normal operation
1	Reset (automatically cleared)

## POWERDOWN

The POWERDOWN bit is located in register R1 only. Setting the bit causes the device to enter powerdown mode. Normal operation is resumed by clearing this bit with MICROWIRE.

**Table 23. POWERDOWN**

R1[17]	State
0	Normal operation
1	Powerdown

## CLKoutX\_HS, Digital Delay Half Shift

This bit subtracts a half clock cycle of the clock distribution path period to the digital delay of CLKoutX. CLKoutX\_HS is used together with CLKoutX\_DDLY to set the digital delay value.

When changing CLKoutX\_HS, the digital delay immediately takes effect without a SYNC event.

**Table 24. CLKoutX\_HS**

R0-R5[16]	State
0	Normal
1	Subtract half of a clock distribution path period from the total digital delay

## CLKoutX\_DIV, Clock Output Divide

CLKoutX\_DIV sets the divide value for the clock output. The divide may be even or odd. Both even and odd divides output a 50% duty cycle clock.

Using a divide value of 26 or greater will cause the clock output to operate in extended mode regardless of the clock output's digital delay value.

Programming CLKoutX\_DIV can require special attention. See section [SPECIAL PROGRAMMING CASE FOR R0 to R5 for CLKoutX\\_DIV & CLKoutX\\_DDLY](#) for more details.

**Table 25. CLKoutX\_DIV, 11 bits**

R0-R5[15:5]	Divide Value	Power Mode
0 (0x00)	Reserved	Normal Mode
1 (0x01)	1 <sup>(1)</sup>	
2 (0x02)	2 <sup>(2)</sup>	
3 (0x03)	3	
4 (0x04)	4 <sup>(2)</sup>	
5 (0x05)	5 <sup>(2)</sup>	
6 (0x06)	6	
...	...	
24 (0x18)	24	
25 (0x19)	25	
26 (0x1A)	26	Extended Mode
27 (0x1B)	27	
...	...	
1044 (0x414)	1044	
1045 (0x415)	1045	

(1) CLKoutX\_HS must = 0 for divide by 1.

(2) After programming PLL2\_N value, a SYNC must occur on channels using this divide value. Programming PLL2\_N does generate a SYNC event automatically which satisfies this requirement, but NO\_SYNC\_CLKoutX must be set to 0 for these clock outputs.

## REGISTERS R6 TO R8

Registers R6 to R8 set the clock output types and analog delays.

### CLKoutX\_TYPE

The clock output types of the LMK04906 are individually programmable. The CLKoutX\_TYPE registers set the output type of an individual clock output to LVDS, LVPECL, LVCMOS, or powers down the output buffer. Note that LVPECL supports four different amplitude levels and LVCMOS supports single LVCMOS outputs, inverted, and normal polarity of each output pin for maximum flexibility.

The programming addresses table shows at what register and address the specified clock output CLKoutX\_TYPE register is located.

The CLKoutX\_TYPE table shows the programming definition for these registers.

**Table 26. CLKoutX\_TYPE Programming Addresses**

CLKoutX	Programming Address
CLKout0	R6[23:20]
CLKout1	R6[27:24]
CLKout2	R7[23:20]
CLKout3	R7[27:24]
CLKout4	R8[19:16]
CLKout5	R8[27:24]

**Table 27. CLKoutX\_TYPE, 4 bits**

R6-R8[31:28, 27:24, 23:20]	Definition
0 (0x00)	Power down
1 (0x01)	LVDS
2 (0x02)	LVPECL (700 mVpp)
3 (0x03)	LVPECL (1200 mVpp)
4 (0x04)	LVPECL (1600 mVpp)
5 (0x05)	LVPECL (2000 mVpp)
6 (0x06)	LVCMOS (Norm/Inv)
7 (0x07)	LVCMOS (Inv/Norm)
8 (0x08)	LVCMOS (Norm/Norm)
9 (0x09)	LVCMOS (Inv/Inv)
10 (0x0A)	LVCMOS (Low/Norm)
11 (0x0A)	LVCMOS (Low/Inv)
12 (0x0C)	LVCMOS (Norm/Low)
13 (0x0D)	LVCMOS (Inv/Low)
14 (0x0E)	LVCMOS (Low/Low)

### CLKoutX\_ADLY

These registers control the analog delay of the clock output CLKoutX. Adding analog delay to the output will increase the noise floor of the output. For this analog delay to be active for a clock output, it must be selected with CLKoutX\_ADLY\_SEL. If neither clock output in a clock output selects the analog delay, then the analog delay block is powered down.

In addition to the programmed delay, a fixed 500 ps of delay will be added by engaging the delay block.

The programming addresses table shows at what register and address the specified clock output CLKoutX\_ADLY register is located.

The CLKoutX\_ADLY table shows the programming definition for these registers.

**Table 28. CLKoutX\_ADLY Programming Addresses**

CLKoutX_ADLY	Programming Address
CLKout0_ADLY	R6[9:5]
CLKout1_ADLY	R6[15:11]
CLKout2_ADLY	R7[9:5]
CLKout3_ADLY	R7[15:11]
CLKout4_ADLY	R8[9:5]
CLKout5_ADLY	R8[15:11]

**Table 29. CLKoutX\_ADLY, 5 bits**

R6-R8[15:11, 9:5]	Definition
0 (0x00)	500 ps + No delay
1 (0x01)	500 ps + 25 ps
2 (0x02)	500 ps + 50 ps
3 (0x03)	500 ps + 75 ps
4 (0x04)	500 ps + 100 ps
5 (0x05)	500 ps + 125 ps
6 (0x06)	500 ps + 150 ps
7 (0x07)	500 ps + 175 ps
8 (0x08)	500 ps + 200 ps
9 (0x09)	500 ps + 225 ps
10 (0x0A)	500 ps + 250 ps
11 (0x0B)	500 ps + 275 ps
12 (0x0C)	500 ps + 300 ps
13 (0x0D)	500 ps + 325 ps
14 (0x0E)	500 ps + 350 ps
15 (0x0F)	500 ps + 375 ps
16 (0x10)	500 ps + 400 ps
17 (0x11)	500 ps + 425 ps
18 (0x12)	500 ps + 450 ps
19 (0x13)	500 ps + 475 ps
20 (0x14)	500 ps + 500 ps
21 (0x15)	500 ps + 525 ps
22 (0x16)	500 ps + 550 ps
23 (0x17)	500 ps + 575 ps

## REGISTER R10

### OScout0\_TYPE

The OSCout0 clock output has a programmable output type. The OSCout0\_TYPE register sets the output type to LVDS, LVPECL, LVCMOS, or powers down the output buffer. Note that LVPECL supports four different amplitude levels and LVCMOS supports dual and single LVCMOS outputs with inverted, and normal polarity of each output pin for maximum flexibility.

To turn on the output, the OSCout0\_TYPE must be set to a non-power down setting and enabled with [EN\\_OSCout0, OSCout0 Output Enable](#).

**Table 30. OSCout0\_TYPE, 4 bits**

R10[27:24]	Definition
0 (0x00)	Powerdown
1 (0x01)	LVDS

**Table 30. OSCout0\_TYPE, 4 bits (continued)**

R10[27:24]	Definition
2 (0x02)	LVPECL (700 mVpp)
3 (0x03)	LVPECL (1200 mVpp)
4 (0x04)	LVPECL (1600 mVpp)
5 (0x05)	LVPECL (2000 mVpp)
6 (0x06)	LVC MOS (Norm/Inv)
7 (0x07)	LVC MOS (Inv/Norm)
8 (0x08)	LVC MOS (Norm/Norm)
9 (0x09)	LVC MOS (Inv/Inv)
10 (0x0A)	LVC MOS (Low/Norm)
11 (0x0B)	LVC MOS (Low/Inv)
12 (0x0C)	LVC MOS (Norm/Low)
13 (0x0D)	LVC MOS (Inv/Low)
14 (0x0E)	LVC MOS (Low/Low)

**EN\_OSCout0, OSCout0 Output Enable**

EN\_OSCout0 is used to enable an oscillator buffered output.

**Table 31. EN\_OSCout0**

R10[22]	Output State
0	OSCout0 Disabled
1	OSCout0 Enabled

OSCout0 note: In addition to enabling the output with EN\_OSCout0. The OSCout0\_TYPE must be programmed to a non-power down value for the output buffer to power up.

**OSCout0\_MUX, Clock Output Mux**

Sets OSCout0 buffer to output a divided or bypassed OSCin signal. The divisor is set by [OSCout\\_DIV](#), [Oscillator Output Divide](#).

**Table 32. OSCout0\_MUX**

R10[20]	Mux Output
0	Bypass divider
1	Divided

**PD\_OSCin, OSCin Powerdown Control**

Except in clock distribution mode, the OSCin buffer must always be powered up.

In clock distribution mode, the OSCin buffer must be powered down if not used.

**Table 33. PD\_OSCin**

R10[19]	OSCin Buffer
0	Normal Operation
1	Powerdown

### **OSCOut\_DIV, Oscillator Output Divide**

The OSCOut divider can be programmed from 2 to 8. Divide by 1 is achieved by bypassing the divider with [OSCOut0\\_MUX, Clock Output Mux](#).

Note that OSCOut\_DIV will be in the PLL1 N feedback path if OSCOut0\_MUX selects divided as an output. When OSCOut\_DIV is in the PLL1 N feedback path, the OSCOut\_DIV divide value must be accounted for when programming PLL1 N.

See [PLL PROGRAMMING](#) for more information on programming PLL1 to lock.

**Table 34. OSCOut\_DIV, 3 bits**

<b>R10[18:16]</b>	<b>Divide</b>
0 (0x00)	8
1 (0x01)	2
2 (0x02)	2
3 (0x03)	3
4 (0x04)	4
5 (0x05)	5
6 (0x06)	6
7 (0x07)	7

### **VCO\_MUX**

When the internal VCO is used, the VCO divider can be selected to divide the VCO output frequency to reduce the frequency on the clock distribution path. It is recommended to use the VCO directly unless:

- Very low output frequencies are required.
- If using the VCO divider results in three or more clock output divider/delays changing from extended to normal power mode, a small power savings may be achieved by using the VCO divider.

A consequence of using the VCO divider is a small degradation in phase noise.

**Table 35. VCO\_MUX**

<b>R10[12]</b>	<b>Divide</b>
0	VCO selected
1	VCO divider selected

### **EN\_FEEDBACK\_MUX**

When using 0-delay or dynamic digital delay (SYNC\_QUAL = 1), EN\_FEEDBACK\_MUX must be set to 1 to power up the feedback mux.

**Table 36. EN\_FEEDBACK\_MUX**

<b>R10[11]</b>	<b>Divide</b>
0	Feedback mux powered down
1	Feedback mux enabled

### **VCO\_DIV, VCO Divider**

Divide value of the VCO Divider.

See [PLL PROGRAMMING](#) for more information on programming PLL2 to lock.

**Table 37. VCO\_DIV, 3 bits**

<b>R10[10:8]</b>	<b>Divide</b>
0 (0x00)	8

**Table 37. VCO\_DIV, 3 bits (continued)**

R10[10:8]	Divide

3 (0x03)	3
4 (0x04)	4
5 (0x05)	5
6 (0x06)	6
7 (0x07)	7

**FEEDBACK\_MUX**

When in 0-delay mode, the feedback mux selects the clock output to be fed back into the PLL1 N Divider.

**Table 38. FEEDBACK\_MUX, 3 bits**

R10[7:5]	Divide
0 (0x00)	Reserved
1 (0x01)	CLKout1
2 (0x02)	Reserved
3 (0x03)	CLKout3
4 (0x04)	CLKout4
5 (0x05)	CLKout5
6 (0x06)	FBCLKin/FBCLKin*

**REGISTER R11****MODE: Device Mode**

MODE determines how the LMK04906 operates from a high level. Different blocks of the device can be powered up and down for specific application requirements from a dual loop architecture to clock distribution.

The LMK04906 can operate in:

- Dual PLL mode with the internal VCO or an external VCO.
- Single PLL mode uses PLL2 and powers down PLL1. OSCin is used for PLL reference input.
- Clock Distribution mode allows use of CLKin1 to distribute to clock outputs CLKout0 through CLKout11, and OSCin to distribute to OSCout0, and optionally CLKout3 through CLKout9.

For the PLL modes, 0-delay can be used have deterministic phase with the input clock.

For the PLL modes it is also possible to use an external VCO.

**Table 39. MODE, 5 bits**

R11[31:27]	Value
0 (0x00)	Dual PLL, Internal VCO
1 (0x01)	Reserved
2 (0x02)	Dual PLL, Internal VCO, 0-Delay
3 (0x03)	Dual PLL, External VCO (Fin)
4 (0x04)	Reserved
5 (0x05)	Dual PLL, External VCO (Fin), 0-Delay
6 (0x06)	PLL2, Internal VCO
7 (0x07)	Reserved
8 (0x08)	PLL2, Internal VCO, 0-Delay

**Table 39. MODE, 5 bits (continued)**

R11[31:27]	Value
9 (0x09)	Reserved
10 (0x0A)	Reserved
11 (0x0B)	PLL2, External VCO (Fin)
12 (0x0C)	Reserved
13 (0x0D)	Reserved
14 (0x0E)	Reserved
15 (0x0F)	Reserved
16 (0x10)	Clock Distribution

### **EN\_SYNC, Enable Synchronization**

The EN\_SYNC bit (default on) must be enabled for synchronization to work. Synchronization is required for dynamic digital delay.

The synchronization enable may be turned off once the clocks are operating to save current. If EN\_SYNC is set after it has been cleared (a transition from 0 to 1), a SYNC is generated that can disrupt the active clock outputs. Setting the NO\_SYNC\_CLKoutX bits will prevent this SYNC pulse from affecting the output clocks. Setting the EN\_SYNC bit is not a valid method for synchronizing the clock outputs. See the section for more information on synchronization.

**Table 40. EN\_SYNC**

R11[26]	Definition
0	Synchronization disabled
1	Synchronization enabled

### **NO\_SYNC\_CLKoutX**

The NO\_SYNC\_CLKoutX bits prevent individual clock outputs from becoming synchronized during a SYNC event. A reason to prevent individual clock output from becoming synchronized is that during synchronization, the clock output is in a fixed low state or can have a glitch pulse.

By disabling SYNC on a clock output, it will continue to operate normally during a SYNC event.

Digital delay requires a SYNC operation to take effect. If NO\_SYNC\_CLKoutX is set before a SYNC event, the digital delay value will be unused.

Setting the NO\_SYNC\_CLKoutX bit has no effect on clocks already synchronized together.

**Table 41. NO\_SYNC\_CLKoutX Programming Addresses**

NO_SYNC_CLKoutX	Programming Address
CLKout0	R11:20
CLKout1	R11:21
CLKout2	R11:22
CLKout3	R11:23
CLKout4	R11:24
CLKout5	R11:25

**Table 42. NO\_SYNC\_CLKoutX**

R11[25, 24, 23, 22, 21, 20]	Definition
0	CLKoutX will synchronize
1	CLKoutX will not synchronize

**SYNC\_CLKin2\_MUX**

Mux controlling SYNC/Status\_CLKin2 pin.

All the outputs logic is active high when SYNC\_TYPE = 3 (Output). All the outputs logic is active low when SYNC\_TYPE = 4 (Output Inverted). For example, when SYNC\_MUX = 0 (Logic Low) and SYNC\_TYPE = 3 (Output) then SYNC outputs a logic low. When SYNC\_MUX = 0 (Logic Low) and SYNC\_TYPE = 4 (Output Inverted) then SYNC outputs a logic high.

**Table 43. SYNC\_MUX, 2 bits**

R11[19:18]	Sync pin output
0 (0x00)	Logic Low
1 (0x01)	CLKin2 LOS
2 (0x02)	CLKin2 Selected
3 (0x03)	uWire Readback

**SYNC\_QUAL**

When SYNC\_QUAL is set, clock outputs will be synchronized to an existing clock output selected by FEEDBACK\_MUX. By using the NO\_SYNC\_CLKoutX bits, selected clock outputs will not be interrupted during the SYNC event.

Qualifying the SYNC by an output clock means that the pulse which turns the clock outputs off and on will have a fixed time relationship to the qualifying output clock.

SYNC\_QUAL = 1 requires CLKout2\_PD = 0 for proper operation. CLKout2\_TYPE may be set to Powerdown mode.

See [Clock Output Synchronization \(SYNC\)](#) for more information.

**Table 44. SYNC\_QUAL**

R11[17]	Mode
0	No qualification
1	Qualification by clock output from feedback mux (Must set CLKout2_PD = 0)

**SYNC\_POL\_INV**

Sets the polarity of the SYNC pin when input. When SYNC is asserted the clock outputs will transition to a low state.

See [Clock Output Synchronization \(SYNC\)](#) for more information on SYNC. A SYNC event can be generated by toggling this bit through the MICROWIRE interface.

**Table 45. SYNC\_POL\_INV**

R11[16]	Polarity
0	SYNC is active high
1	SYNC is active low

**SYNC\_EN\_AUTO**

When set, causes a SYNC event to occur when programming register R0 to R5 to adjust digital delay values.

The SYNC event will coincide with the LEuWire pin falling edge.

Refer to [SPECIAL PROGRAMMING CASE FOR R0 to R5 for CLKoutX\\_DIV & CLKoutX\\_DDLY](#) for more information on possible special programming considerations when SYNC\_EN\_AUTO = 1.

**Table 46. SYNC\_EN\_AUTO**

R11[15]	Mode
0	Manual SYNC
1	SYNC Internally Generated

### SYNC\_TYPE

Sets the IO type of the SYNC pin.

**Table 47. SYNC\_TYPE, 3 bits**

R11[14:12]	Polarity
0 (0x00)	Input
1 (0x01)	Input /w pull-up resistor
2 (0x02)	Input /w pull-down resistor
3 (0x03)	Output (push-pull)
4 (0x04)	Output inverted (push-pull)
5 (0x05)	Output (open source)
6 (0x06)	Output (open drain)

When in output mode the SYNC input is forced to 0 regardless of the SYNC\_MUX setting. A synchronization can then be activated by uWire by programming the SYNC\_POL\_INV register to active low to assert SYNC. SYNC can then be released by programming SYNC\_POL\_INV to active high. Using this uWire programming method to create a SYNC event saves the need for an IO pin from another device.

### EN\_PLL2\_XTAL

If an external crystal is being used to implement a discrete VCXO, the internal feedback amplifier must be enabled with this bit in order to complete the oscillator circuit.

**Table 48. EN\_PLL2\_XTAL**

R11[5]	Oscillator Amplifier State
0	Disabled
1	Enabled

## REGISTER R12

### LD\_MUX

LD\_MUX sets the output value of the LD pin.

All the outputs logic is active high when LD\_TYPE = 3 (Output). All the outputs logic is active low when LD\_TYPE = 4 (Output Inverted). For example, when LD\_MUX = 0 (Logic Low) and LD\_TYPE = 3 (Output) then Status\_LD outputs a logic low. When LD\_MUX = 0 (Logic Low) and LD\_TYPE = 4 (Output Inverted) then Status\_LD outputs a logic high.

**Table 49. LD\_MUX, 5 bits**

R12[31:27]	Divide
0 (0x00)	Logic Low
1 (0x01)	PLL1 DLD
2 (0x02)	PLL2 DLD
3 (0x03)	PLL1 & PLL2 DLD
4 (0x04)	Holdover Status
5 (0x05)	DAC Locked
6 (0x06)	Reserved
7 (0x07)	uWire Readback

**Table 49. LD\_MUX, 5 bits (continued)**

R12[31:27]	Divide
8 (0x08)	DAC Rail
9 (0x09)	DAC Low
10 (0x0A)	DAC High
11 (0x0B)	PLL1_N
12 (0x0C)	PLL1_N/2
13 (0x0D)	PLL2 N
14 (0x0E)	PLL2 N/2
15 (0x0F)	PLL1_R
16 (0x10)	PLL1_R/2
17 (0x11)	PLL2 R <sup>(1)</sup>
18 (0x12)	PLL2 R/2 <sup>(1)</sup>

(1) Only valid when HOLDOVER\_MUX is not set to 2 (PLL2\_DLD) or 3 (PLL1 & PLL2 DLD).

**LD\_TYPE**

Sets the IO type of the LD pin.

**Table 50. LD\_TYPE, 3 bits**

R12[26:24]	Polarity
0 (0x00)	Reserved
1 (0x01)	Reserved

4 (0x04)	Output inverted (push-pull)
5 (0x05)	Output (open source)
6 (0x06)	Output (open drain)

**SYNC\_PLLX\_DLD**

By setting SYNC\_PLLX\_DLD a SYNC mode will be engaged (asserted SYNC) until PLL1 and/or PLL2 locks. SYNC\_QUAL must be 0 to use this functionality.

**Table 51. SYNC\_PLL2\_DLD**

R12[23]	Sync Mode Forced
0	No
1	Yes

**Table 52. SYNC\_PLL1\_DLD**

R12[22]	Sync Mode Forced
0	No
1	Yes

### **EN\_TRACK**

Enable the DAC to track the PLL1 tuning voltage. For optional use in in holdover mode.

Tracking can be used to monitor PLL1 voltage by readback of DAC\_CNT register in any mode.

**Table 53. EN\_TRACK**

<b>R12[8]</b>	<b>DAC Tracking</b>
0	Disabled
1	Enabled

### **HOLDOVER\_MODE**

Enable the holdover mode.

**Table 54. HOLDOVER\_MODE, 2 bits**

<b>R12[7:6]</b>	<b>Holdover Mode</b>
0	Reserved
1	Disabled
2	Enabled
3	Reserved

### **REGISTER R13**

#### **HOLDOVER\_MUX**

HOLDOVER\_MUX sets the output value of the Status\_Holdover pin.

The outputs are active high when HOLDOVER\_TYPE = 3 (Output). The outputs are active low when HOLDOVER\_TYPE = 4 (Output Inverted).

**Table 55. HOLDOVER\_MUX, 5 bits**

<b>R13[31:27]</b>	<b>Divide</b>
0 (0x00)	Logic Low
1 (0x01)	PLL1 DLD
2 (0x02)	PLL2 DLD
3 (0x03)	PLL1 & PLL2 DLD
4 (0x04)	Holdover Status
5 (0x05)	DAC Locked
6 (0x06)	Reserved
7 (0x07)	uWire Readback
8 (0x08)	DAC Rail
9 (0x09)	DAC Low
10 (0x0A)	DAC High
11 (0x0B)	PLL1 N
12 (0x0C)	PLL1 N/2
13 (0x0D)	PLL2 N
14 (0x0E)	PLL2 N/2
15 (0x0F)	PLL1 R
16 (0x10)	PLL1 R/2
17 (0x11)	PLL2 R <sup>(1)</sup>
18 (0x12)	PLL2 R/2 <sup>(1)</sup>

(1) Only valid when LD\_MUX is not set to 2 (PLL2\_DLD) or 3 (PLL1 & PLL2 DLD).

**HOLDOVER\_TYPE**

Sets the IO mode of the Status\_Holdover pin.

**Table 56. HOLDOVER\_TYPE, 3 bits**

R13[26:24]	Polarity
0 (0x00)	Reserved
1 (0x01)	Reserved
2 (0x02)	Reserved
3 (0x03)	Output (push-pull)
4 (0x04)	Output inverted (push-pull)
5 (0x05)	Output (open source)
6 (0x06)	Output (open drain)

**Status\_CLKin1\_MUX**

Status\_CLKin1\_MUX sets the output value of the Status\_CLKin1 pin. If [Status\\_CLKin1\\_TYPE](#) is set to an input type, this register has no effect. This MUX register only sets the output signal.

The outputs are active high when Status\_CLKin1\_TYPE = 3 (Output). The outputs are active low when Status\_CLKin1\_TYPE = 4 (Output Inverted).

**Table 57. Status\_CLKin1\_MUX, 3 bits**

R13[22:20]	Divide
0 (0x00)	Logic Low
1 (0x01)	CLKin1 LOS
2 (0x02)	CLKin1 Selected
3 (0x03)	DAC Locked
4 (0x04)	DAC Low
5 (0x05)	DAC High
6 (0x06)	uWire Readback

**Status\_CLKin0\_TYPE**

Status\_CLKin0\_TYPE sets the IO type of the Status\_CLKin0 pin.

**Table 58. Status\_CLKin0\_TYPE, 3 bits**

R13[18:16]	Polarity
0 (0x00)	Input
1 (0x01)	Input /w pull-up resistor
2 (0x02)	Input /w pull-down resistor
3 (0x03)	Output (push-pull)
4 (0x04)	Output inverted (push-pull)
5 (0x05)	Output (open source)
6 (0x06)	Output (open drain)

**DISABLE\_DLD1\_DET**

DISABLE\_DLD1\_DET disables the HOLDOVER mode from being activated when PLL1 lock detect signal transitions from high to low.

When using Pin Select Mode as the input clock switch mode, this bit should normally be set.

**Table 59. DISABLE\_DLD1\_DET**

R13[15]	Holdover DLD1 Detect
0	PLL1 DLD causes clock switch event
1	PLL1 DLD <b>does not</b> cause clock switch event

### Status\_CLKin0\_MUX

CLKin0\_MUX sets the output value of the Status\_CLKin0 pin. If [Status\\_CLKin0\\_TYPE](#) is set to an input type, this register has no effect. This MUX register only sets the output signal.

The outputs logic is active high when Status\_CLKin0\_TYPE = 3 (Output). The outputs logic is active low when Status\_CLKin0\_TYPE = 4 (Output Inverted).

**Table 60. Status\_CLKin0\_MUX, 3 bits**

R13[14:12]	Divide
0 (0x00)	Logic Low
1 (0x01)	CLKin0 LOS
2 (0x02)	CLKin0 Selected
3 (0x03)	DAC Locked
4 (0x04)	DAC Low
5 (0x05)	DAC High
6 (0x06)	uWire Readback

### CLKin\_SELECT\_MODE

CLKin\_SELECT\_MODE sets the mode used in determining reference CLKin for PLL1.

**Table 61. CLKin\_SELECT\_MODE, 3 bits**

R13[11:9]	Mode
0 (0x00)	CLKin0 Manual
1 (0x01)	CLKin1 Manual
2 (0x02)	CLKin2 Manual
3 (0x03)	Pin Select Mode
4 (0x04)	Auto Mode
5 (0x05)	Reserved
6 (0x06)	Auto mode & next clock pin select
7 (0x07)	Reserved

### CLKin\_Sel\_INV

CLKin\_Sel\_INV sets the input polarity of Status\_CLKin0 and Status\_CLKin1 pins.

**Table 62. CLKin\_Sel\_INV**

R13[8]	Input
0	Active High
1	Active Low

**EN\_CLKinX**

Each clock input can individually be enabled to be used during auto-switching CLKin\_SELECT\_MODE. Clock input switching priority is always CLKin0 → CLKin1 → CLKin2 → CLKin0.

**Table 63. EN\_CLKin2**

R13[7]	Input
0	No

R13[6]	Valid
0	No
1	Yes

**Table 65. EN\_CLKin0**

R13[5]	Valid
0	No
1	Yes

**REGISTER 14****LOS\_TIMEOUT**

This bit controls the amount of time in which no activity on a CLKin causes LOS (Loss-of-Signal) to be asserted.

**Table 66. LOS\_TIMEOUT, 2 bits**

R14[31:30]	Timeout
0 (0x00)	1200 ns, 420 kHz
1 (0x01)	206 ns, 2.5 MHz
2 (0x02)	52.9 ns, 10 MHz
3 (0x03)	23.7 ns, 22 MHz

**EN\_LOS**

Enables the LOS (Loss-of-Signal) timeout control.

**Table 67. EN\_LOS**

R14[28]	LOS
0	Disabled
1	Enabled

**Status\_CLKin1\_TYPE**

Sets the IO type of the Status\_CLKin1 pin.

**Table 68. Status\_CLKin1\_TYPE, 3 bits**

R14[26:24]	Polarity
0 (0x00)	Input
1 (0x01)	Input /w pull-up resistor
2 (0x02)	Input /w pull-down resistor
3 (0x03)	Output (push-pull)

**Table 68. Status\_CLKin1\_TYPE, 3 bits (continued)**

R14[26:24]	Polarity
4 (0x04)	Output inverted (push-pull)
5 (0x05)	Output (open source)
6 (0x06)	Output (open drain)

**CLKinX\_BUF\_TYPE, PLL1 CLKinX/CLKinX\* Buffer Type**

There are two input buffer types for the PLL1 reference clock inputs: either bipolar or CMOS. Bipolar is recommended for differential inputs such as LVDS and LVPECL. CMOS is recommended for DC coupled single ended inputs.

When using bipolar, CLKinX and CLKinX\* input pins must be AC coupled when using a differential or single ended input.

When using CMOS, CLKinX and CLKinX\* input pins may be AC or DC coupled with a differential input.

When using CMOS in single ended mode, the unused clock input pin (CLKinX or CLKinX\*) must be AC grounded. The used clock input pin (CLKinX\* or CLKinX) may be AC or DC coupled to the signal source.

The programming addresses table shows at what register and address the specified CLKinX\_BUF\_TYPE bit is located.

The CLKinX\_BUF\_TYPE table shows the programming definition for these registers.

**Table 69. CLKinX\_BUF\_TYPE Programming Addresses**

CLKinX_BUF_TYPE	Programming Address
CLKin2_BUF_TYPE	R14[22]
CLKin1_BUF_TYPE	R14[21]
CLKin0_BUF_TYPE	R14[20]

**Table 70. CLKinX\_BUF\_TYPE**

R14[22, 21, 20]	CLKinX Buffer Type
0	Bipolar
1	CMOS

**DAC\_HIGH\_TRIP**

Voltage from Vcc at which holdover mode is entered if EN\_VTUNE\_RAIL\_DAC is enabled. Will also set flags which can be monitored out Status\_LD/Status\_Holdover pins.

Step size is ~51 mV

**Table 71. DAC\_HIGH\_TRIP, 6 bits**

R14[19:14]	Trip voltage from Vcc (V)
0 (0x00)	1 × Vcc / 64
1 (0x01)	2 × Vcc / 64
2 (0x02)	3 × Vcc / 64
3 (0x03)	4 × Vcc / 64
4 (0x04)	5 × Vcc / 64
...	...
61 (0x3D)	62 × Vcc / 64
62 (0x3E)	63 × Vcc / 64
63 (0x3F)	64 × Vcc / 64

**DAC\_LOW\_TRIP**

Voltage from GND at which holdover mode is entered if EN\_VTUNE\_RAIL\_DAC is enabled. Will also set flags which can be monitored out Status\_LD/Status\_Holdover pins.

Step size is ~51 mV

**Table 72. DAC\_LOW\_TRIP, 6 bits**

R14[11:6]	Trip voltage from GND (V)
0 (0x00)	$1 \times V_{cc} / 64$
1 (0x01)	$2 \times V_{cc} / 64$
2 (0x02)	$3 \times V_{cc} / 64$
3 (0x03)	$4 \times V_{cc} / 64$
4 (0x04)	$5 \times V_{cc} / 64$
...	...
61 (0x3D)	$62 \times V_{cc} / 64$
62 (0x3E)	$63 \times V_{cc} / 64$
63 (0x3F)	$64 \times V_{cc} / 64$

**EN\_VTUNE\_RAIL\_DET**

Enables the DAC Vtune rail detection. When the DAC achieves a specified Vtune, if this bit is enabled, the current clock input is considered invalid and an input clock switch event is generated.

**Table 73. EN\_VTUNE\_RAIL\_DET**

R14[5]	State
0	Disabled
1	Enabled

**REGISTER 15****MAN\_DAC**

Sets the DAC value when in manual DAC mode in ~3.2 mV steps.

**Table 74. MAN\_DAC, 10 bits**

R15[31:22]	DAC Voltage
0 (0x00)	$0 \times V_{cc} / 1023$
1 (0x01)	$1 \times V_{cc} / 1023$
2 (0x02)	$2 \times V_{cc} / 1023$
...	...
1023 (0x3FF)	$1023 \times V_{cc} / 1023$

**EN\_MAN\_DAC**

This bit enables the manual DAC mode.

**Table 75. EN\_MAN\_DAC**

R15[20]	DAC Mode
0	Automatic
1	Manual

## ***HOLDOVER\_DLD\_CNT***

Lock must be valid for this many clocks of PLL1 PDF before holdover mode is exited.

**Table 76. HOLDOVER\_DLD\_CNT, 14 bits**

<b>R15[19:6]</b>	<b>Exit Counts</b>
0 (0x00)	Reserved
1 (0x01)	1
2 (0x02)	2
...	...
16,383 (0x3FFF)	16,383

## ***FORCE\_HOLDOVER***

This bit forces the holdover mode.

When holdover is forced, if in fixed CPout1 mode, then the DAC will set the programmed MAN\_DAC value. If in tracked CPout1 mode, then the DAC will set the current tracked DAC value.

Setting FORCE\_HOLDOVER does not constitute a clock input switch event unless DISABLE\_DLD1\_DET = 0, since in holdover mode, PLL1\_DLD = 0 this will trigger the clock input switch event.

**Table 77. FORCE\_HOLDOVER**

<b>R15[5]</b>	<b>Holdover</b>
0	Disabled
1	Enabled

## **REGISTER 16**

### ***XTAL\_LVL***

Sets the peak amplitude on the tunable crystal.

Increasing this value can improve the crystal oscillator phase noise performance at the cost of increased current and higher crystal power dissipation levels.

**Table 78. XTAL\_LVL, 2 bits**

<b>R15[31:22]</b>	<b>Peak Amplitude<sup>(1)</sup></b>
0 (0x00)	1.65 Vpp
1 (0x01)	1.75 Vpp
2 (0x02)	1.90 Vpp
3 (0x03)	2.05 Vpp

(1) At crystal frequency of 20.48 MHz

## **REGISTER 23**

This register must not be programmed, it is a readback only register.

### ***DAC\_CNT***

The DAC\_CNT register is 10 bits in size and located at readback bit position [23:14]. When using tracking mode for holdover, the DAC value can be readback at this address.

## **REGISTER 24**

### ***PLL2\_C4\_LF, PLL2 Integrated Loop Filter Component***

Internal loop filter components are available for PLL2, enabling either 3rd or 4th order loop filters without requiring external components.

Internal loop filter capacitor C4 can be set according to the following table.

**Table 79. PLL2\_C4\_LF, 4 bits**

<b>R24[31:28]</b>	<b>Loop Filter Capacitance(pF)</b>
0 (0x00)	10 pF
1 (0x01)	15 pF
2 (0x02)	29 pF
3 (0x03)	34 pF
4 (0x04)	47 pF
5 (0x05)	52 pF
6 (0x06)	66 pF
7 (0x07)	71 pF
8 (0x08)	103 pF
9 (0x09)	108 pF
10 (0x0A)	122 pF
11 (0x0B)	126 pF
12 (0x0C)	141 pF
13 (0x0D)	146 pF
14 (0x0E)	Reserved
15 (0x0F)	Reserved

#### **PLL2\_C3\_LF, PLL2 Integrated Loop Filter Component**

Internal loop filter components are available for PLL2, enabling either 3rd or 4th order loop filters without requiring external components.

Internal loop filter capacitor C3 can be set according to the following table.

**Table 80. PLL2\_C3\_LF, 4 bits**

<b>R24[27:24]</b>	<b>Loop Filter Capacitance(pF)</b>
0 (0x00)	10 pF
1 (0x01)	11 pF
2 (0x02)	15 pF
3 (0x03)	16 pF
4 (0x04)	19 pF
5 (0x05)	20 pF
6 (0x06)	24 pF
7 (0x07)	25 pF
8 (0x08)	29 pF
9 (0x09)	30 pF
10 (0x0A)	33 pF
11 (0x0B)	34 pF
12 (0x0C)	38 pF
13 (0x0D)	39 pF
14 (0x0E)	Reserved
15 (0x0F)	Reserved

#### **PLL2\_R4\_LF, PLL2 Integrated Loop Filter Component**

Internal loop filter components are available for PLL2, enabling either 3rd or 4th order loop filters without requiring external components.

Internal loop filter resistor R4 can be set according to the following table.

**Table 81. PLL2\_R4\_LF, 3 bits**

<b>R24[22:20]</b>	<b>Resistance</b>
0 (0x00)	200 $\Omega$
1 (0x01)	1 k $\Omega$
2 (0x02)	2 k $\Omega$
3 (0x03)	4 k $\Omega$
4 (0x04)	16 k $\Omega$
5 (0x05)	Reserved
6 (0x06)	Reserved
7 (0x07)	Reserved

**PLL2\_R3\_LF, PLL2 Integrated Loop Filter Component**

Internal loop filter components are available for PLL2, enabling either 3rd or 4th order loop filters without requiring external components.

Internal loop filter resistor R3 can be set according to the following table.

**Table 82. PLL2\_R3\_LF, 3 bits**

<b>R24[18:16]</b>	<b>Resistance</b>
0 (0x00)	200 $\Omega$
1 (0x01)	1 k $\Omega$
2 (0x02)	2 k $\Omega$
3 (0x03)	4 k $\Omega$
4 (0x04)	16 k $\Omega$
5 (0x05)	Reserved
6 (0x06)	Reserved
7 (0x07)	Reserved

**PLL1\_N\_DLY**

Increasing delay of PLL1\_N\_DLY will cause the outputs to lead from CLKinX. For use in 0-delay mode.

**Table 83. PLL1\_N\_DLY, 3 bits**

<b>R24[14:12]</b>	<b>Definition</b>
0 (0x00)	0 ps
1 (0x01)	205 ps
2 (0x02)	410 ps
3 (0x03)	615 ps
4 (0x04)	820 ps

5 (0x05)	1025 ps
6 (0x06)	1230 ps
7 (0x07)	1435 ps

**PLL1\_WND\_SIZE**

PLL1\_WND\_SIZE sets the window size used for digital lock detect for PLL1. If the phase error between the reference and feedback of PLL1 is less than specified time, then the PLL1 lock counter increments.

Refer to [DIGITAL LOCK DETECT FREQUENCY ACCURACY](#) for more information.

**Table 85. PLL1\_WND\_SIZE, 2 bits**

R24[7:6]	Definition
0	5.5 ns
1	10 ns
2	18.6 ns
3	40 ns

**REGISTER 25****DAC\_CLK\_DIV**

The DAC update clock frequency is the PLL1 phase detector frequency divided by this divisor.

**Table 86. DAC\_CLK\_DIV, 10 bits**

R25[31:22]	Divide
0 (0x00)	Reserved
1 (0x01)	1

16,383 (0x3FFF)	16,383

## REGISTER 26

### ***PLL2\_WND\_SIZE***

PLL2\_WND\_SIZE sets the window size used for digital lock detect for PLL2. If the phase error between the reference and feedback of PLL2 is less than specified time, then the PLL2 lock counter increments. This value must be programmed to 2 (3.7 ns).

Refer to [DIGITAL LOCK DETECT FREQUENCY ACCURACY](#) for more information.

**Table 88. PLL2\_WND\_SIZE, 2 bits**

R26[31:30]	Definition
0	Reserved
1	Reserved
2	3.7 ns
3	Reserved

### ***EN\_PLL2\_REF\_2X, PLL2 Reference Frequency Doubler***

Enabling the PLL2 reference frequency doubler allows for higher phase detector frequencies on PLL2 than would normally be allowed with the given VCXO or Crystal frequency.

Higher phase detector frequencies reduces the PLL N values which makes the design of wider loop bandwidth filters possible.

Refer to [PLL PROGRAMMING](#) for more information on how to program the PLL dividers to lock the PLL.

**Table 89. EN\_PLL2\_REF\_2X**

R26[29]	Description
0	Reference frequency normal <sup>(1)</sup>
1	Reference frequency doubled (2x)

(1) When the doubler is not enabled, PLL2\_R should not be programmed to 1.

### ***PLL2\_CP\_POL, PLL2 Charge Pump Polarity***

PLL2\_CP\_POL sets the charge pump polarity for PLL2. The internal VCO requires the negative charge pump polarity to be selected. Many VCOs use positive slope.

A positive slope VCO increases output frequency with increasing voltage. A negative slope VCO decreases output frequency with increasing voltage.

**Table 90. PLL2\_CP\_POL**

R26[28]	Description
0	Negative Slope VCO/VCXO
1	Positive Slope VCO/VCXO

### ***PLL2\_CP\_GAIN, PLL2 Charge Pump Current***

This bit programs the PLL2 charge pump output current level. The table below also illustrates the impact of the PLL2 TRI-STATE bit in conjunction with PLL2\_CP\_GAIN.

**Table 91. PLL2\_CP\_GAIN, 2 bits**

R26[27:26]	PLL2_CP_TRI R27[5]	Charge Pump Current (μA)
X	1	Hi-Z
0 (0x00)	0	100
1 (0x01)	0	400

**Table 91. PLL2\_CP\_GAIN, 2 bits (continued)**

R26[27:26]	PLL2_CP_TRI R27[5]	Charge Pump Current (μA)
2 (0x02)	0	1600
3 (0x03)	0	3200

**PLL2\_DLD\_CNT**

The reference and feedback of PLL2 must be within the window of phase error as specified by PLL2\_WND\_SIZE for **PLL2\_DLD\_CNT** cycles before PLL2 digital lock detect is asserted.

Refer to [DIGITAL LOCK DETECT FREQUENCY ACCURACY](#) for more information

**Table 92. PLL2\_DLD\_CNT, 14 bits**

R26[19:6]	Divide

**PLL2\_CP\_TRI, PLL2 Charge Pump TRI-STATE**

This bit allows for the PLL2 charge pump output pin, CPout2, to be placed into TRI-STATE.

**Table 93. PLL2\_CP\_TRI**

R26[5]	Description
0	PLL2 CPout2 is active
1	PLL2 CPout2 is at TRI-STATE

**REGISTER 27****PLL1\_CP\_POL, PLL1 Charge Pump Polarity**

PLL1\_CP\_POL sets the charge pump polarity for PLL1. Many VCXOs use positive slope.

A positive slope VCXO increases output frequency with increasing voltage. A negative slope VCXO decreases output frequency with increasing voltage.

**Table 94. PLL1\_CP\_POL**

R27[28]	Description
0	Negative Slope VCO/VCXO
1	Positive Slope VCO/VCXO

**PLL1\_CP\_GAIN, PLL1 Charge Pump Current**

This bit programs the PLL1 charge pump output current level. The table below also illustrates the impact of the PLL1 TRI-STATE bit in conjunction with PLL1\_CP\_GAIN.

**Table 95. PLL1\_CP\_GAIN, 2 bits**

R26[27:26]	PLL1_CP_TRI R27[5]	Charge Pump Current (μA)

3 (0x03)	0	1600

### CLKinX\_PreR\_DIV

The pre-R dividers before the PLL1 R divider can be programmed such that when the active clock input is switched, the frequency at the input of the PLL1 R divider will be the same. This allows PLL1 to stay in lock without needing to re-program the PLL1 R register when different clock input frequencies are used. This is especially useful in the auto CLKin switching modes.

**Table 96. CLKinX\_PreR\_DIV Programming Addresses**

CLKinX_PreR_DIV	Programming Address
CLKin2_PreR_DIV	R27[25:24]
CLKin1_PreR_DIV	R27[23:22]
CLKin0_PreR_DIV	R27[21:20]

**Table 97. CLKinX\_PreR\_DIV, 2 bits**

### PLL1\_CP\_TRI, PLL1 Charge Pump TRI-STATE

This bit allows for the PLL1 charge pump output pin, CPout1, to be placed into TRI-STATE.

**Table 99. PLL1\_CP\_TRI**

R27[5]	Description
0	PLL1 CPout1 is active
1	PLL1 CPout1 is at TRI-STATE

**REGISTER 28*****PLL2\_R, PLL2 R Divider***

The reference path into the PLL2 phase detector includes the PLL2 R divider.

Refer to [PLL PROGRAMMING](#) for more information on how to program the PLL dividers to lock the PLL.

The valid values for PLL2\_R are shown in the table below.

**Table 100. PLL2\_R, 12 bits**

<b>R28[31:20]</b>	<b>Divide</b>
0 (0x00)	Not Valid
1 (0x01)	1 <sup>(1)</sup>
2 (0x02)	2
3 (0x03)	3
...	...
4,094 (0xFFE)	4,094
4,095 (0xFFFF)	4,095

(1) When using PLL2\_R divide value of 1, the PLL2 reference doubler should be used (EN\_PLL2\_REF\_2X = 1).

***PLL1\_N, PLL1 N Divider***

The feedback path into the PLL1 phase detector includes the PLL1 N divider.

Refer to [PLL PROGRAMMING](#) for more information on how to program the PLL dividers to lock the PLL.

The valid values for PLL1\_N are shown in the table below.

**Table 101. PLL1\_N, 14 bits**

<b>R28[19:6]</b>	<b>Divide</b>
0 (0x00)	Not Valid
1 (0x01)	1
2 (0x02)	2
...	...
4,095 (0xFFFF)	4,095

**REGISTER 29*****OSCin\_FREQ, PLL2 Oscillator Input Frequency Register***

The frequency of the PLL2 reference input to the PLL2 Phase Detector (OSCin/OSCin\* port) must be programmed in order to support proper operation of the frequency calibration routine which locks the internal VCO to the target frequency.

**Table 102. OSCin\_FREQ, 3 bits**

<b>R29[26:24]</b>	<b>OSCin Frequency</b>
0 (0x00)	0 to 63 MHz
1 (0x01)	>63 MHz to 127 MHz
2 (0x02)	>127 MHz to 255 MHz
3 (0x03)	Reserved
4 (0x04)	>255 MHz to 400 MHz

### ***PLL2\_FAST\_PDF, High PLL2 Phase Detector Frequency***

When PLL2 phase detector frequency is greater than 100 MHz, set the PLL2\_FAST\_PDF to ensure proper operation of device.

**Table 103. PLL2\_FAST\_PDF**

<b>R29[23]</b>	<b>PLL2 PDF</b>
0	Less than or equal to 100 MHz
1	Greater than 100 MHz

### ***PLL2\_N\_CAL, PLL2 N Calibration Divider***

During the frequency calibration routine, the PLL uses the divide value of the PLL2\_N\_CAL register instead of the divide value of the PLL2\_N register to lock the VCO to the target frequency.

Refer to [PLL PROGRAMMING](#) for more information on how to program the PLL dividers to lock the PLL.

**Table 104. PLL2\_N\_CAL, 18 bits**

<b>R30[22:5]</b>	<b>Divide</b>
0 (0x00)	Not Valid
1 (0x01)	1
2 (0x02)	2
...	...
262,143 (0x3FFFF)	262,143

## **REGISTER 30**

If an internal VCO mode is used, programming Register 30 triggers the frequency calibration routine. This calibration routine will also generate a SYNC event. See [Clock Output Synchronization \(SYNC\)](#) for more details on a SYNC.

### ***PLL2\_P, PLL2 N Prescaler Divider***

The PLL2 N Prescaler divides the output of the VCO as selected by Mode\_MUX1 and is connected to the PLL2 N divider.

Refer to [PLL PROGRAMMING](#) for more information on how to program the PLL dividers to lock the PLL.

**Table 105. PLL2\_P, 3 bits**

<b>R30[26:24]</b>	<b>Divide Value</b>
0 (0x00)	8
1 (0x01)	2
2 (0x02)	2
3 (0x03)	3
4 (0x04)	4
5 (0x05)	5
6 (0x06)	6
7 (0x07)	7

### ***PLL2\_N, PLL2 N Divider***

The feedback path into the PLL2 phase detector includes the PLL2 N divider.

Each time register 30 is updated via the MICROWIRE interface, a frequency calibration routine runs to lock the VCO to the target frequency. During this calibration PLL2\_N is substituted with PLL2\_N\_CAL.

Refer to [PLL PROGRAMMING](#) for more information on how to program the PLL dividers to lock the PLL.

The valid values for PLL2\_N are shown in the table below.

**Table 106. PLL2\_N, 18 bits**

R30[22:5]	Divide
0 (0x00)	Not Valid
1 (0x01)	1
2 (0x02)	2
	...
262,143 (0x3FFFF)	262,143

**REGISTER 31*****READBACK\_LE***

Sets the required state of the LEuWire pin when performing register readback.

Refer to [READBACK](#)

**Table 107. READBACK\_LE**

R31[21]	Register
0 (0x00)	LE must be low for readback
1 (0x01)	LE must be high for readback

***READBACK\_ADDR***

Sets the address of the register to read back when performing readback.

When reading register 12, the READBACK\_ADDR will be read back at R12[20:16].

When reading back from R31 bits 6 to 31 should be ignored. Only uWire\_LOCK is valid.

Refer to [REGISTER READBACK](#) for more information on readback.

**Table 108. READBACK\_ADDR, 5 bits**

R31[20:16]	Register
0 (0x00)	R0
1 (0x01)	R1
2 (0x02)	R2
3 (0x03)	R3
4 (0x04)	R4
5 (0x05)	R5

28 (0x1C)	R28
29 (0x1D)	R29
30 (0x1E)	R30
31 (0x1F)	R31

***uWire\_LOCK***

Setting *uWire\_LOCK* will prevent any changes to *uWire* registers R0 to R30. Only by clearing the *uWire\_LOCK* bit in R31 can the *uWire* registers be unlocked and written to once more.

It is not necessary to lock the registers to perform a readback operation.

**Table 109. uWire\_LOCK**

<b>R31[5]</b>	<b>State</b>
0	Registers unlocked
1	Registers locked, Write-protect

## APPLICATION INFORMATION

### FREQUENCY PLANNING WITH THE LMK04906 FAMILY

Calculating the value of the output dividers for use with the LMK04906 family is simple due to the architecture of the LMK04906. That is, the VCO divider may be bypassed and the clock output dividers allow for even and odd output divide values from 2 to 1045. For most applications it is recommended to bypass the VCO divider.

The procedure for determining the needed LMK04906 device and clock output divider values for a set of clock output frequencies is straightforward.

1. Calculate the least common multiple (LCM) of the clock output frequencies.
2. Determine which VCO ranges will support the target clock output frequencies given the LCM.
3. Determine the clock output divide values based on VCO frequency.
4. Determine the PLL2 reference frequency doubler mode and PLL2\_P, PLL2\_N, and PLL2\_R divider values given the OSCin VCXO or crystal frequency and VCO frequency.

For example, given the following target output frequencies: 200 MHz, 120 MHz, and 25 MHz with a VCXO frequency of 40 MHz:

**First** determine the LCM of the three frequencies.  $\text{LCM}(200 \text{ MHz}, 120 \text{ MHz}, 25 \text{ MHz}) = 600 \text{ MHz}$ . The LCM frequency is the lowest frequency for which all of the target output frequencies are integer divisors of the LCM. *Note, if there is one frequency which causes the LCM to be very large, greater than 3 GHz for example, determine if there is a single frequency requirement which causes this. It may be possible to select the VCXO/crystal frequency to satisfy this frequency requirement through OSCout or CLKout3/4 driven by OSCin. In this way it is possible to get non-integer related frequencies at the outputs.*

**Second**, since the LCM is not in a VCO frequency range supported by the LMK04906, multiply the LCM frequency by an integer which causes it to fall into a valid VCO frequency range of an LMK04906 device. In this case  $600 \text{ MHz} * 4 = 2400 \text{ MHz}$  which is valid for the LMK04906.

**Third**, continuing the example by using a VCO frequency of 2400 MHz and the LMK04906, the CLKout dividers can be calculated by simply dividing the VCO frequency by the output frequency. To output 200 MHz, 120 MHz, and 25 MHz the output dividers will be 12, 20, and 96 respectively.

- $2400 \text{ MHz} / 200 \text{ MHz} = 12$
- $2400 \text{ MHz} / 120 \text{ MHz} = 20$
- $2400 \text{ MHz} / 25 \text{ MHz} = 96$

**Fourth**, PLL2 must be locked to its input reference. Refer to [PLL PROGRAMMING](#) for more information on this topic. By programming the clock output dividers and the PLL2 dividers the VCO can lock to the frequency of 2400 MHz and the clock outputs dividers will each divide the VCO frequency down to the target output frequencies of 200 MHz, 120 MHz, and 25 MHz.

#### NOTE

Refer to application note AN-1865 Frequency Synthesis and Planning for PLL Architectures for more information on this topic and LCM calculations.

### PLL PROGRAMMING

To lock a PLL the divided reference and divided feedback from VCO or VCXO must result in the same phase detector frequency. The tables below illustrate how the dividers are structured for the reference path (R) and feedback path (N) depending on the MODE of the device.

**Table 110. PLL1 Phase Detector Frequency — Reference Path (R)**

MODE	(R) PLL1 PDF =
All	$\text{CLKinX Frequency} / \text{CLKinX\_PreR\_DIV} / \text{PLL1\_R}$

**Table 111. PLL1 Phase Detector Frequency — Feedback Path (N)**

MODE	VCO_MUX	OSCout0	PLL1 PDF (N) =
Internal VCO Dual PLL	—	Bypass	VCXO Frequency / PLL1_N
	—	Divided	VCXO Frequency / OSCin_DIV / PLL1_N
Internal VCO /w 0-delay	Bypass	—	VCO Frequency / CLKoutX_DIV / PLL1_N <sup>(1)</sup>
	Divided	—	VCO Frequency / VCO_DIV / CLKoutX_DIV / PLL1_N <sup>(1)</sup>

(1) The actual CLKoutX\_DIV used is selected by **FEEDBACK\_MUX**.

**Table 112. PLL2 Phase Detector Frequency — Reference Path (R)**

EN_PLL2_REF_2X	PLL2 PDF (R) =
Disabled	OSCin Frequency / PLL2_R <sup>(1)</sup>
Enabled	OSCin Frequency * 2 / PLL2_R <sup>(1)</sup>

(1) For applications in which the OSCin frequency and PLL2 phase detector frequency are equal, the best PLL2 in-band noise can be achieved when the doubler is enabled (EN\_PLL2\_REF\_2X = 1) and the PLL2 R divide value is 2. Do not use doubler disabled (EN\_PLL2\_REF\_2X = 0) and PLL2 R divide value of 1.

**Table 113. PLL2 Phase Detector Frequency — Feedback Path (N)**

MODE	VCO_MUX	PLL2 PDF (N) =
Dual PLL	VCO	VCO Frequency / PLL2_P / PLL2_N
Dual PLL /w 0-delay		
Single PLL		
Dual PLL	VCO Divider	VCO Frequency / VCO_DIV / PLL2_P / PLL2_N
Dual PLL /w 0-delay		
Single PLL		
Dual PLL External VCO	—	VCO Frequency / VCO_DIV / PLL2_P / PLL2_N
Dual PLL External VCO /w 0-delay		
Single PLL /w 0-delay	VCO	VCO Frequency / CLKoutX_DIV / PLL2_N
	VCO Divider	VCO Frequency / VCO_DIV / CLKoutX_DIV / PLL2_N

**Table 114. PLL2 Phase Detector Frequency — Feedback Path (N) during VCO Frequency Calibration**

MODE	VCO_MUX	PLL2 PDF (N_CAL) =
All Internal VCO Modes	VCO	VCO Frequency / PLL2_P / PLL2_N_CAL
	VCO Divider	VCO Frequency / VCO_DIV / PLL2_P / PLL2_N_CAL

### Example PLL2 N Divider Programming

To program PLL2 to lock an LMK04906 using Dual PLL mode to a VCO frequency of 2400 MHz using a 40 MHz VCXO reference, first determine the total PLL2 N divide value. This is VCO Frequency / PLL2 phase detector frequency. This example assumes the PLL2 reference frequency doubler is enabled and a PLL2 R divider value of 2 <sup>(1)</sup> which results in PLL2 R divide value of 1 which results in PLL2 phase detector frequency the same as PLL2 reference frequency (40 MHz). 2400 MHz / 40 MHz = 60, so the total PLL2 N divide value is 60.

The dividers in the PLL2 N feedback path for Dual PLL mode include PLL2\_P and PLL2\_N. PLL2\_P can be programmed from 2 to 8 even and odd. PLL2\_N can be programmed from 1 to 263,143 even and odd. Since the total PLL2 N divide value of 60 contains the factors 2, 2, 3, and 5, it would be allowable to program PLL2\_P to 2, 3 or 5. It is simplest to use the smallest divide, so PLL2\_P = 2, and PLL2\_N = 30 which results in a Total PLL2 N = 60.

For this example and in most cases, PLL2\_N\_CAL will have the same value as PLL2\_N. However when using Single PLL mode with 0-delay, the values will differ. When using an external VCO, PLL2\_N\_CAL value is unused.

(1) For applications in which the OSCin frequency and PLL2 phase detector frequency are equal, the best PLL2 in-band noise can be achieved when the doubler is enabled (EN\_PLL2\_REF\_2X = 1) and the PLL2 R divide value is 2. Do not use doubler disabled (EN\_PLL2\_REF\_2X = 0) and PLL2 R divide value of 1.

## LOOP FILTER

Each PLL of the LMK04906 requires a dedicated loop filter.

### PLL1

The loop filter for PLL1 must be connected to the CPout1 pin. Figure 21 shows a simple 2-pole loop filter. The output of the filter drives an external VCXO module or discrete implementation of a VCXO using a crystal resonator and external varactor diode. Higher order loop filters may be implemented using additional external R and C components. It is recommended the loop filter for PLL1 result in a total closed loop bandwidth in the range of 10 Hz to 200 Hz. The design of the loop filter is application specific and highly dependent on parameters such as the phase noise of the reference clock, VCXO phase noise, and phase detector frequency for PLL1. TI's Clock Conditioner Owner's Manual covers this topic in detail and TI's Clock Design Tool can be used to simulate loop filter designs for both PLLs.

These resources may be found: [http://www.ti.com/lscs/ti/analog/clocksandtimers/clocks\\_and\\_timers.page](http://www.ti.com/lscs/ti/analog/clocksandtimers/clocks_and_timers.page).

### PLL2

As shown in Figure 21, the charge pump for PLL2 is directly connected to the optional internal loop filter components, which are normally used only if either a third or fourth pole is needed. The first and second poles are implemented with external components. The loop must be designed to be stable over the entire application-specific tuning range of the VCO. The designer should note the range of  $K_{VCO}$  listed in the table of Electrical Characteristics and how this value can change over the expected range of VCO tuning frequencies. Because loop bandwidth is directly proportional to  $K_{VCO}$ , the designer should model and simulate the loop at the expected extremes of the desired tuning range, using the appropriate values for  $K_{VCO}$ .

When designing with the integrated loop filter of the LMK04906 family, considerations for minimum resistor thermal noise often lead one to the decision to design for the minimum value for integrated resistors, R3 and R4.

Both the integrated loop filter resistors (R3 and R4) and capacitors (C3 and C4) also restrict the maximum loop bandwidth. However, these integrated components do have the advantage that they are closer to the VCO and can therefore filter out some noise and spurs better than external components. For this reason, a common strategy is to minimize the internal loop filter resistors and then design for the largest internal capacitor values that permit a wide enough loop bandwidth. In situations where spur requirements are very stringent and there is margin on phase noise, a feasible strategy would be to design a loop filter with integrated resistor values larger than their minimum value.

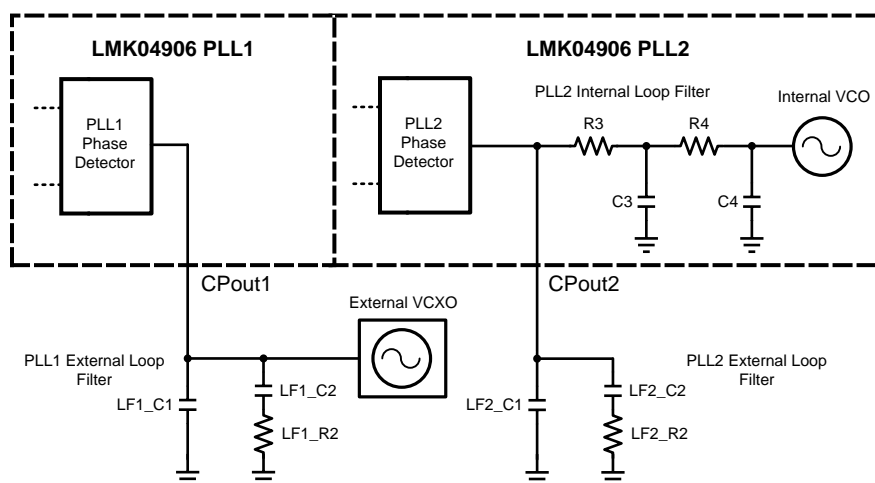

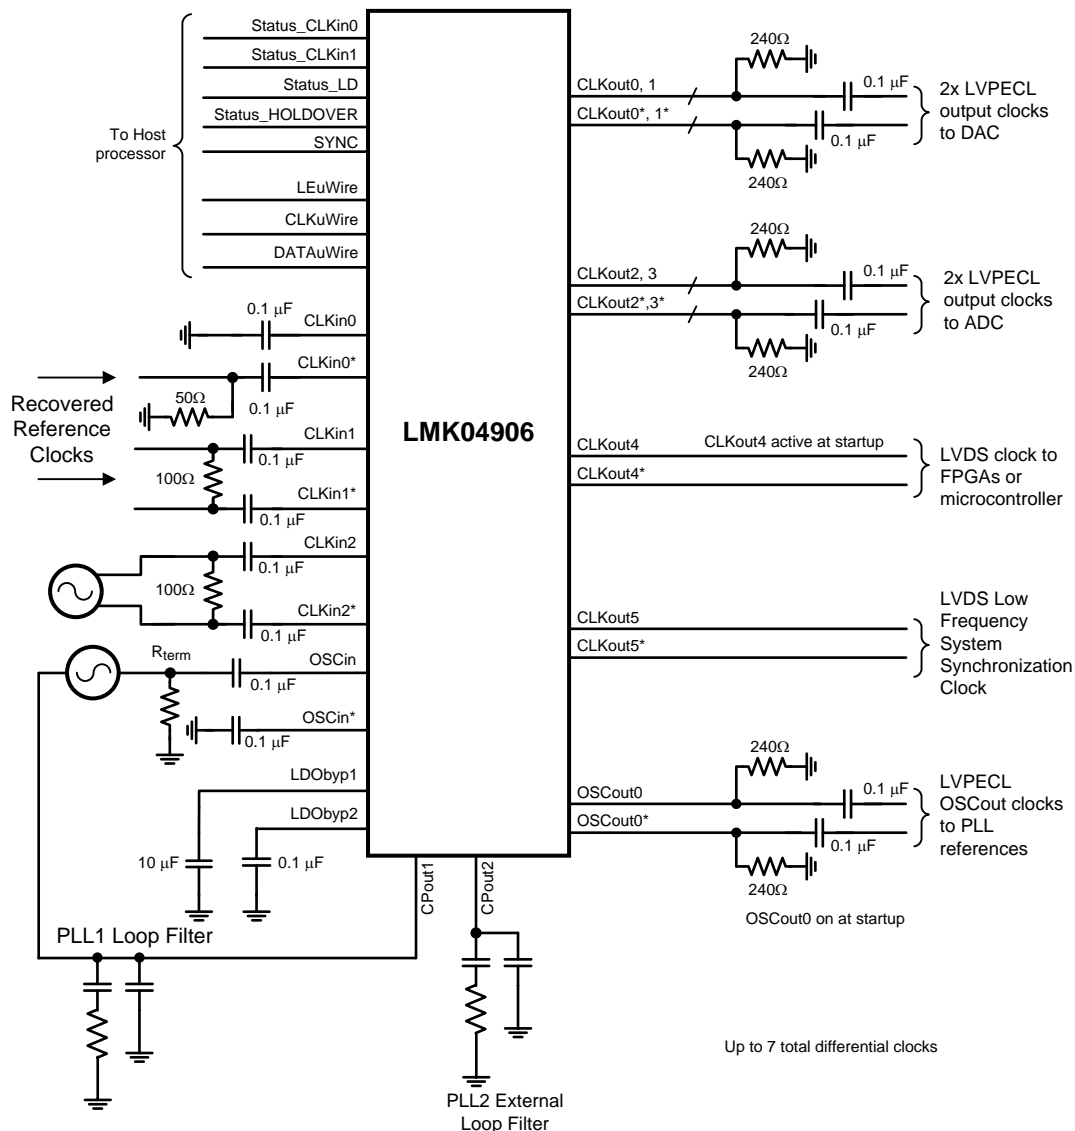

Figure 21. PLL1 and PLL2 Loop Filters

## SYSTEM LEVEL DIAGRAM

Figure 22 and Figure 23 show an LMK04906 family device with external circuitry for clocking and for power supply to serve as a guideline for good practices when designing with the LMK04906 family. Refer to [PIN CONNECTION RECOMMENDATIONS](#) for more details on the pin connections and bypassing recommendations. Also refer to the evaluation board. PCB design will also play a role in device performance.

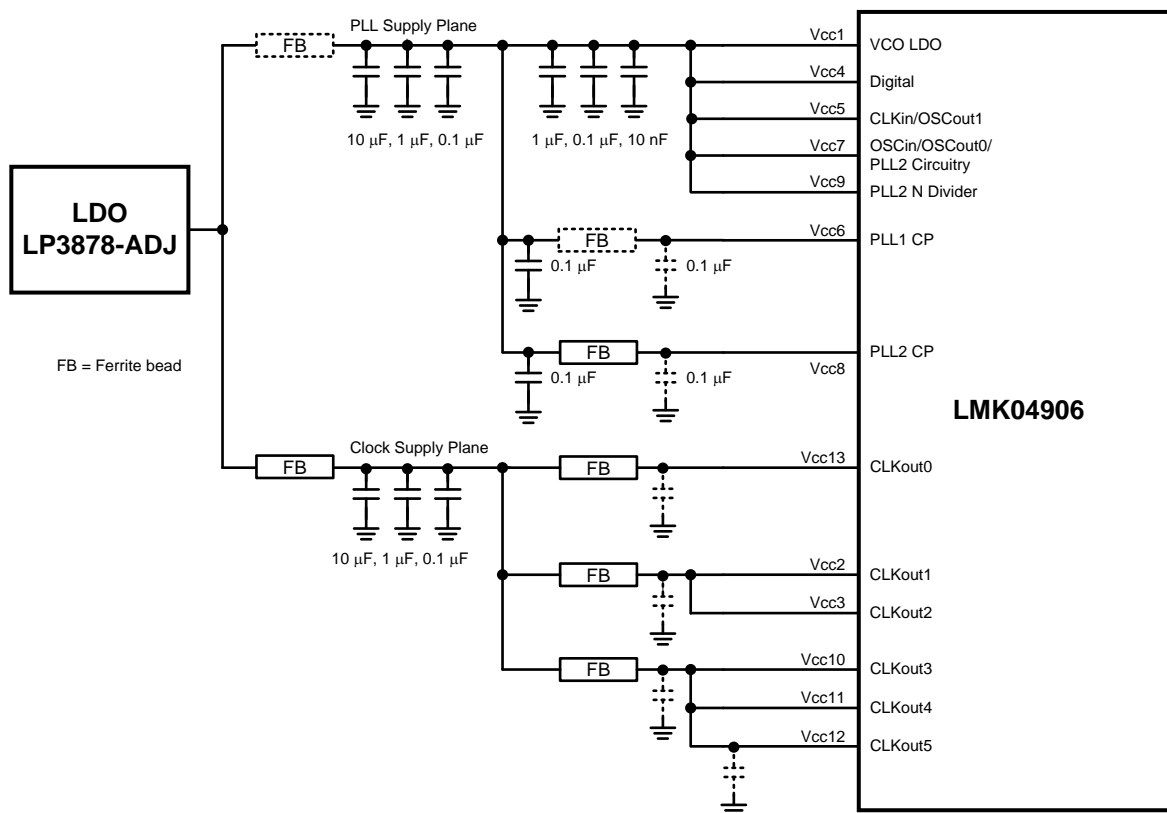

**Figure 22. Example Application – System Schematic Except for Power**

Figure 22 shows the primary reference clock input is at CLKin0/0\*. A secondary reference clock is driving CLKin1/1\*. Both clocks are depicted as AC coupled differential drivers. The VCXO attached to the OSCin/OSCin\* port is configured as an AC coupled single-ended driver. Any of the input ports (CLKin0/0\*, CLKin1/1\*, CLKin2/2\* or OSCin/OSCin\*) may be configured as either differential or single-ended. These options are discussed later in the data sheet.

See for more information on PLL1 and PLL2 loop filters.

The clock outputs are all AC coupled with 0.1 μF capacitors. Some clock outputs are depicted as LVPECL with 240 Ω emitter resistors and some clock outputs as LVDS. However, the output format of the clock outputs will vary by user programming, so the user should use the appropriate source termination for each clock output. Later sections of this data sheet illustrate alternative methods for AC coupling, DC coupling and terminating the clock outputs.

PCB design will influence crosstalk performance. Tightly coupled clock traces will have less crosstalk than loosely coupled clock traces. Also proximity to other clocks traces will influence crosstalk.

**Figure 23. Example Application – Power System Schematic**

Figure 23 shows an example decoupling and bypassing scheme for the LMK04906. Components drawn in dotted lines are optional. Two power planes are used in this design, one for the clock outputs and one for other PLL circuits.

PCB design will influence impedance to the supply. Vias and traces will increase the impedance to the power supply. Ensure good direct return current paths.

## PIN CONNECTION RECOMMENDATIONS

### Vcc Pins and Decoupling

All Vcc pins must always be connected.

Integrated capacitance on the LMK04906 makes external high frequency decoupling capacitors ( $\leq 1$  nF) unnecessary. The internal capacitance is more effective at filtering high frequency noise than off device bypass capacitance because there is no bond wire inductance between the LMK04906 circuit and the bypass capacitor.

### Vcc2, Vcc3, Vcc10, Vcc11, Vcc12, Vcc13 (CLKout Vccs)

Each of these pins has an internal 200 pF of capacitance.

Ferrite beads may be used to reduce crosstalk between different clock output frequencies on the same LMK04906 device. Ferrite beads placed between the power supply and a clock Vcc pin will reduce noise between the Vcc pin and the power supply. When several output clocks share the same frequency a single ferrite bead can be used between the power supply and each same frequency CLKout Vcc pin.

When using ferrite beads on CLKout Vcc pins, care must be taken to ensure the power supply can source the needed switching current.

- In most cases a ferrite bead may be placed and the internal capacitance is sufficient.

- If a ferrite bead is used with a low frequency output (typically  $\leq 10$  MHz) and a high current switching clock output format such as non-complementary LVCMOS or high swing LVPECL is used, then...
  - the ferrite bead can be removed to the lower impedance to the main power supply and bypass capacitors, or
  - localized capacitance can be placed between the ferrite bead and Vcc pin to support the switching current.
  - Note that decoupling capacitors used between the ferrite bead and a CLKout Vcc pin can permit high frequency switching noise to couple through the capacitors into the ground plane and onto other CLKout Vcc pins with decoupling capacitors. This can degrade crosstalk performance.

### **Vcc1 (VCO), Vcc4 (Digital), and Vcc9 (PLL2)**

Each of these pins has internal bypass capacitance.

Ferrite beads should not be used between these pins and the power supply/large bypass capacitors because these Vcc pins don't produce much noise or a ferrite bead can cause phase noise disturbances and resonances.

The typical application diagram in [Figure 23](#) shows all these Vccs connected to together to Vcc without a ferrite bead.

### **Vcc6 (PLL1 Charge Pump) and Vcc8 (PLL2 Charge Pump)**

Each of these pins has an internal bypass capacitor.

Use of a ferrite bead between the power supply/large bypass capacitors and PLL1 is optional. PLL1 charge pump can be connected directly to Vcc along with Vcc1, Vcc4, and Vcc9. Depending on the application, a 0.1 uF capacitor may be placed close to PLL1 charge pump Vcc pin.

A ferrite bead should be placed between the power supply/large bypass capacitors and Vcc8. Most applications have high PLL2 phase detector frequencies and ( $> 50$  MHz) such that the internal bypassing is sufficient and a ferrite bead can be used to isolate this switching noise from other circuits. For lower phase detector frequencies a ferrite bead is optional and depending on application a 0.1 uF capacitor may be added on Vcc8.

### **Vcc5 (CLKin), Vcc7 (OSCIin & OSCOut0)**

Each of these pins has an internal 100 pF of capacitance. No ferrite bead should be placed between the power supply/large bypass capacitors and Vcc5 or Vcc7.

These pins are unique since they supply an output clock and other circuitry.

Vcc5 supplies CLKin.

Vcc7 supplies OSCin, OSCOut0, and PLL2 circuitry.

### **LVPECL Outputs**

When using an LVPECL output it is not recommended to place a capacitor to ground on the output as might be done when using a capacitor input LC lowpass filter. The capacitor will appear as a short to the LVPECL output drivers which are able to supply large amounts of switching current. The effect of the LVPECL sourcing large switching currents can result in:

1. Large switching currents through the Vcc pin of the LVPECL power supply resulting in more Vcc noise and possible Vcc spikes.
2. Large switching currents injected into the ground plane through the capacitor which could couple onto other Vcc pins with bypass capacitors to ground resulting in more Vcc noise and possible Vcc spikes.

### **Unused Clock Outputs**

Leave unused clock outputs floating and powered down.

### **Unused Clock Inputs**

Unused clock inputs can be left floating.

## LDO Bypass

The LDObyp1 and LDObyp2 pins should be connected to GND through external capacitors, as shown in the diagram.

## DIGITAL LOCK DETECT FREQUENCY ACCURACY

The digital lock detect circuit is used to determine PLL1 locked, PLL2 locked, and holdover exit events. A window size and lock count register are programmed to set a ppm frequency accuracy of reference to feedback signals of the PLL for each event to occur. When a PLL digital lock event occurs the PLL's digital lock detect is asserted true. When the holdover exit event occurs, the device will exit holdover mode.

Event	PLL	Window size	Lock count
PLL1 Locked	PLL1	PLL1_WND_SIZE	PLL1_DLD_CNT
PLL2 Locked	PLL2	PLL2_WND_SIZE	PLL2_DLD_CNT
Holdover exit	PLL1	PLL1_WND_SIZE	HOLDOVER_DLD_CNT

For a digital lock detect event to occur there must be a "lock count" number of phase detector cycles of PLLX during which the time/phase error of the PLLX\_R reference and PLLX\_N feedback signal edges are within the user programmable "window size." Since there must be at least "lock count" phase detector events before a lock event occurs, a minimum digital lock event time can be calculated as "lock count" /  $f_{PDX}$  where X = 1 for PLL1 or 2 for PLL2.

By using [Equation 3](#), values for a "lock count" and "window size" can be chosen to set the frequency accuracy required by the system in ppm before the digital lock detect event occurs:

$$\text{ppm} = \frac{2e6 \times \text{PLLX\_WND\_SIZE} \times f_{PDX}}{\text{PLLX\_DLD\_CNT}} \quad (3)$$

The effect of the "lock count" value is that it shortens the effective lock window size by dividing the "window size" by "lock count".

If at any time the PLLX\_R reference and PLLX\_N feedback signals are outside the time window set by "window size", then the "lock count" value is reset to 0.

### Minimum Lock Time Calculation Example

To calculate the minimum PLL2 digital lock time given a PLL2 phase detector frequency of 40 MHz and PLL2\_DLD\_CNT = 10,000. Then the minimum lock time of PLL2 will be 10,000 / 40 MHz = 250  $\mu$ s.

## CALCULATING DYNAMIC DIGITAL DELAY VALUES FOR ANY DIVIDE

This section explains how to calculate the dynamic digital delay for any divide value.

Dynamic digital delay allows the time offset between two or more clock outputs to be adjusted with no or minimal interruption of clock outputs. Since the clock outputs are operating at a known frequency, the time offset can also be expressed as a phase shift. When dynamically adjusting the digital delay of clock outputs with different frequencies the phase shift should be expressed in terms of the higher frequency clock. The step size of the smallest time adjustment possible is equal to half the period of the Clock Distribution Path, which is the VCO frequency ([Equation 1](#)) or the VCO frequency divided by the VCO divider ([Equation 2](#)) if not bypassed. The smallest degree phase adjustment with respect to a clock frequency will be  $360^\circ \times \text{the smallest time adjustment} \times \text{the clock frequency}$ . The total number of phase offsets that the LMK04906 family is able to achieve using dynamic digital delay is equal  $1 / (\text{higher clock frequency} \times \text{the smallest phase adjustment})$ .

[Equation 4](#) calculates the digital delay value that must be programmed for a synchronizing clock to achieve a 0 time/phase offset from the qualifying clock. Once this digital delay value is known, it is possible to calculate the digital delay value for any phase offset. The qualifying clock for dynamic digital delay is selected by the FEEDBACK\_MUX. When dynamic digital delay is engaged with same clock output used for the qualifying clock and the new synchronized clock, it is termed relative dynamic digital delay since causing another SYNC event with the same digital delay value will offset the clock by the same phase once again. The important part of relative dynamic digital delay is that the CLKoutX\_HS must be programmed correctly when the SYNC event occurs ([Table 9](#)). This can result in needing to program the device twice. Once to set the new CLKoutX\_DDLY with CLKoutX\_HS as required for the SYNC event, and again to set the CLKoutX\_HS to its desired value.

Digital delay values are programmed using the CLKoutX\_DDLY and CLKoutX\_HS registers as shown in Equation 5. For example, to achieve a digital delay of 13.5, program CLKoutX\_DDLY = 14 and CLKoutX\_HS = 1.

$$0 \text{ digital delay} = \left( \left( \left\lceil \frac{16}{\text{CLKoutX\_DIV}} \right\rceil + 0.5 \right) \times \text{CLKoutX\_DIV} \right) - 11.5 \quad (4)$$

Equation 4 uses the ceiling operator. To find the ceiling of a fractional number round up. An integer remains the same value.

$$\text{Digital delay} = \text{CLKoutX\_DDLY} - (0.5 * \text{CLKoutX\_HS}) \quad (5)$$

Note: since the digital delay value for 0 time/phase offset is a function of the qualifying clock's divide value, the resulting digital delay value can be used for any clock output operating at any frequency to achieve a 0 time/phase offset from the qualifying clock. Therefore the calculated time shift table will also be the same as in Table 115

### Example

Consider a system with:

- A VCO frequency of 2000 MHz.
- The VCO divider is bypassed, therefore the clock distribution path frequency is 2000 MHz.
- CLKout0\_DIV = 10 resulting in a 200 MHz frequency on CLKout0.
- CLKout2\_DIV = 20 resulting in a 100 MHz frequency on CLKout2.

For this system the minimum time adjustment is 0.25 ns, which is 0.5 / (2000 MHz). Since the higher frequency is 200 MHz, phase adjustments will be calculated with respect to the 200 MHz frequency. The 0.25 ns minimum time adjustment results in a minimum phase adjustment of 18 degrees, which is 360 degrees / 200 MHz \* 0.25 ns.

To calculate the digital delay value to achieve a 0 time/phase shift of CLKout2 when CLKout0 is the qualifying clock. Solve Equation 4 using the divide value of 10. To solve the equation 16/10 = 1.6, the ceiling of 1.6 is 2. Then to finish solving the equation solve (2 + 0.5) \* 10 - 11.5 = 13.5. A digital delay value of 13.5 is programmed by setting CLKout2\_DDLY = 14 and CLKout2\_HS = 1.

To calculate the digital delay value to achieve a 0 time/phase shift of CLKout0 when CLKout2 is the qualifying clock, solve Equation 4 using the divide value of CLKout2, which is 20. This results in a digital delay of 18.5 which is programmed as CLKout0\_DDLY = 19 and CLKout0\_HS = 1.

Once the 0 time/phase shift digital delay programming value is known a table can be constructed with the digital delay value to be programmed for any time/phase offset by decrementing or incrementing the digital delay value by 0.5 for the minimum time/phase adjustment.

A complete filled out table for use of CLKout0 as the qualifying clock is shown in Table 115. It was created by entering a digital delay of 13.5 for 0 degree phase shift, then decrementing the digital delay down to the minimum value of 4.5. Since this did not result in all the possible phase shifts, the digital delay was then incremented from 13.5 to 14.0 to complete all possible phase shifts.

**Table 115. Example Digital Delay Calculation**

Digital delay	Calculated time shift (ns)	Relative time shift to 200 MHz (ns)	Phase shift of 200 MHz (degrees)
4.5	-4.5	0.5	36
5	-4.25	0.75	54
5.5	-4.0	1.0	72
6	-3.75	1.25	90
6.5	-3.5	1.5	108
7	-3.25	1.75	126
7.5	-3.0	2.0	144
8	-2.75	2.25	162
8.5	-2.5	2.5	180
9	-2.25	2.75	198

**Table 115. Example Digital Delay Calculation (continued)**

Digital delay	Calculated time shift (ns)	Relative time shift to 200 MHz (ns)	Phase shift of 200 MHz (degrees)
9.5	-2.0	3.0	216
10	-1.75	3.25	234
10.5	-1.5	3.5	252
11	-1.25	3.75	270
11.5	-1.0	4.0	288
12	-0.75	4.25	306
12.5	-0.5	4.5	324
13	-0.25	4.75	342
<b>13.5</b>	<b>0</b>	<b>0</b>	<b>0</b>
14	0.25	0.25	18
14.5	0.5	0.5	36

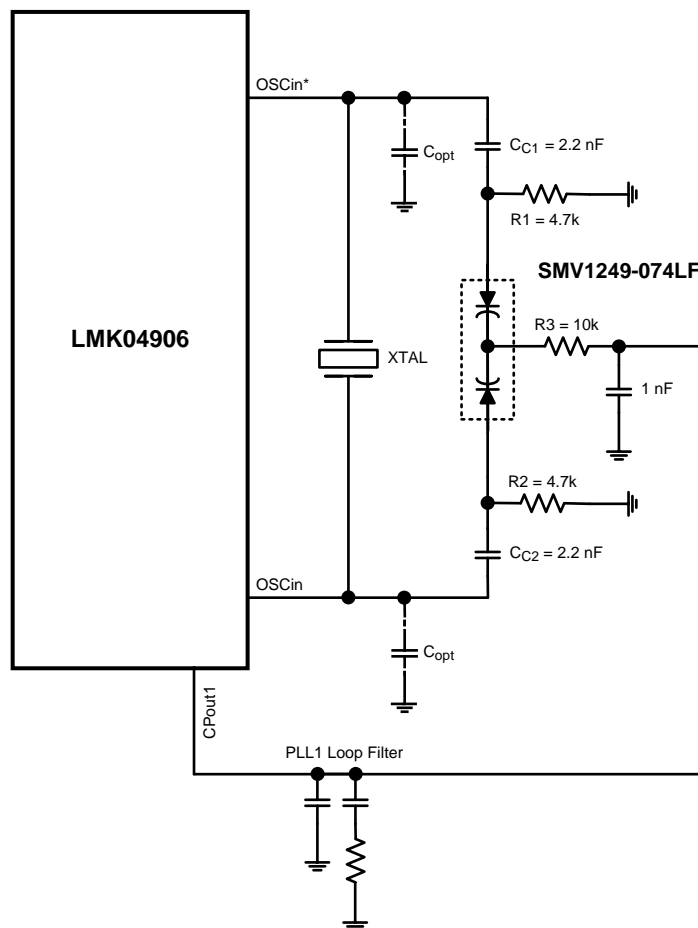

Observe that the digital delay value of 4.5 and 14.5 will achieve the same relative time shift/phase delay. However programming a digital delay of 14.5 will result in a clock off time for the synchronizing clock to achieve the same phase time shift/phase delay.

Digital delay value is programmed as  $\text{CLKoutX\_DDLY} - (0.5 * \text{CLKoutX\_HS})$ . So to achieve a digital delay of 13.5, program  $\text{CLKoutX\_DDLY} = 14$  and  $\text{CLKoutX\_HS} = 1$ . To achieve a digital delay of 14, program  $\text{CLKoutX\_DDLY} = 14$  and  $\text{CLKoutX\_HS} = 0$ .

### OPTIONAL CRYSTAL OSCILLATOR IMPLEMENTATION (OSCin/OSCin\*)

The LMK04906 family features supporting circuitry for a discretely implemented oscillator driving the OSCin port pins. [Figure 24](#) illustrates a reference design circuit for a crystal oscillator:

**Figure 24. Reference Design Circuit for Crystal Oscillator Option**

This circuit topology represents a parallel resonant mode oscillator design. When selecting a crystal for parallel resonance, the total load capacitance,  $C_L$ , must be specified. The load capacitance is the sum of the tuning capacitance ( $C_{TUNE}$ ), the capacitance seen looking into the OSCin port ( $C_{IN}$ ), and stray capacitance due to PCB parasitics ( $C_{STRAY}$ ), and is given by Equation 6.

$$C_L = C_{TUNE} + C_{IN} + \frac{C_{STRAY}}{2} \quad (6)$$

$C_{TUNE}$  is provided by the varactor diode shown in Figure 24, Skyworks model SMV1249-074LF. A dual diode package with common cathode provides the variable capacitance for tuning. The single diode capacitance ranges from approximately 31 pF at 0.3 V to 3.4 pF at 3 V. The capacitance range of the dual package (anode to anode) is approximately 15.5 pF at 3 V to 1.7 pF at 0.3 V. The desired value of  $V_{TUNE}$  applied to the diode should be  $V_{CC}/2$ , or 1.65 V for  $V_{CC} = 3.3$  V. The typical performance curve from the data sheet for the SMV1249-074LF indicates that the capacitance at this voltage is approximately 6 pF ( $12 \text{ pF} / 2$ ).

The nominal input capacitance ( $C_{IN}$ ) of the LMK04906 family OSCin pins is 6 pF. The stray capacitance ( $C_{STRAY}$ ) of the PCB should be minimized by arranging the oscillator circuit layout to achieve trace lengths as short as possible and as narrow as possible trace width (50  $\Omega$  characteristic impedance is not required). As an example, assume that  $C_{STRAY}$  is 4 pF. The total load capacitance is nominally:

$$C_L = 6 + 6 + \frac{4}{2} = 14 \text{ pF} \quad (7)$$

Consequently the load capacitance specification for the crystal in this case should be nominally 14 pF.

The 2.2 nF capacitors shown in the circuit are coupling capacitors that block the DC tuning voltage applied by the 4.7 k $\Omega$  and 10 k $\Omega$  resistors. The value of these coupling capacitors should be large, relative to the value of  $C_{TUNE}$  ( $C_{C1} = C_{C2} \gg C_{TUNE}$ ), so that  $C_{TUNE}$  becomes the dominant capacitance.

For a specific value of  $C_L$ , the corresponding resonant frequency ( $F_L$ ) of the parallel resonant mode circuit is:

$$F_L = F_S \cdot \left\{ \frac{C_1}{2(C_0 + C_{L1})} + 1 \right\} = F_S \cdot \left\{ \frac{1}{2 \left( \frac{C_0}{C_1} + \frac{C_L}{C_1} \right)} + 1 \right\} \quad (8)$$

$F_S$  = Series resonant frequency

$C_1$  = Motional capacitance of the crystal

$C_L$  = Load capacitance

$C_0$  = Shunt capacitance of the crystal, specified on the crystal datasheet

The normalized tuning range of the circuit is closely approximated by:

$$\frac{\Delta F}{F} = \frac{F_{CL1} - F_{CL2}}{F_{FCL1}} = \frac{C_1}{2} \cdot \left\{ \frac{1}{(C_0 + C_{L1})} - \frac{1}{(C_0 + C_{L2})} \right\} = \frac{1}{2} \cdot \left\{ \frac{1}{\left( \frac{C_0}{C_1} + \frac{C_{L1}}{C_1} \right)} - \frac{1}{\left( \frac{C_0}{C_1} + \frac{C_{L2}}{C_1} \right)} \right\} \quad (9)$$

$C_{L1}$ ,  $C_{L2}$  = The endpoints of the circuit's load capacitance range, assuming a variable capacitance element is one component of the load.  $F_{CL1}$ ,  $F_{CL2}$  = parallel resonant frequencies at the extremes of the circuit's load capacitance range.

A common range for the pullability ratio,  $C_0/C_1$ , is 250 to 280. The ratio of the load capacitance to the shunt capacitance is  $\sim(n * 1000)$ ,  $n < 10$ . Hence, picking a crystal with a smaller pullability ratio supports a wider tuning range because this allows the scale factors related to the load capacitance to dominate.

Examples of the phase noise and jitter performance of the LMK04906 with a crystal oscillator are shown in [Table 116](#). This table illustrates the clock output phase noise when a 20.48 MHz crystal is paired with PLL1.

**Table 116. Example RMS Jitter and Clock Output Phase Noise for LMK04906 with a 20.48 MHz Crystal Driving OSCin (T = 25 °C, V<sub>CC</sub> = 3.3 V) <sup>(1)</sup>**

RMS Jitter (ps)				
Integration Bandwidth	Clock Output Type	PLL2 PDF = 20.48 MHz (EN_PLL2_REF2X = 0, XTAL_LVL = 3)	PLL2 PDF = 40.96 MHz (EN_PLL2_REF2X = 1, XTAL_LVL = 3)	
		f <sub>CLK</sub> = 245.76 MHz	f <sub>CLK</sub> = 122.88 MHz	f <sub>CLK</sub> = 245.76 MHz

(1) Performance data and crystal specifications contained in this section are based on Vectron model VXB1-1150-20M480, 20.48 MHz. PLL1 has a narrow loop bandwidth, PLL2 loop parameters are: C1 = 150 pF, C2 = 120 nF, R2 = 470 Ω, Charge Pump current = 3.2 mA, Phase detector frequency = 20.48 MHz or 40.96 MHz, VCO frequency = 2949.12 MHz. Loop filter was optimized for 40.96 MHz phase detector performance.

Example crystal specifications are presented in [Table 117](#).

**Table 117. Example Crystal Specifications**

Parameter	Value
Nominal Frequency (MHz)	20.48
Frequency Stability, T = 25 °C	± 10 ppm
Operating temperature range	-40 °C to +85 °C
Frequency Stability, -40 °C to +85 °C	± 15 ppm
Load Capacitance	14 pF
Shunt Capacitance (C <sub>0</sub> )	5 pF Maximum
Motional Capacitance (C <sub>1</sub> )	20 fF ± 30%

**Table 117. Example Crystal Specifications (continued)**

Parameter	Value
Equivalent Series Resistance	25 Ω Maximum
Drive level	2 mWatts Maximum
C <sub>0</sub> /C <sub>1</sub> ratio	225 typical, 250 Maximum

See [Figure 25](#) for a representative tuning curve.

**Figure 25. Example Tuning Curve, 20.48 MHz Crystal**

The tuning curve achieved in the user's application may differ from the curve shown above due to differences in PCB layout and component selection.

This data is measured on the bench with the crystal integrated with the LMK04906 family. Using a voltmeter to monitor the V<sub>TUNE</sub> node for the crystal, the PLL1 reference clock input frequency is swept in frequency and the resulting tuning voltage generated by PLL1 is measured at each frequency. At each value of the reference clock frequency, the lock state of PLL1 should be monitored to ensure that the tuning voltage applied to the crystal is valid.

The curve shows over the tuning voltage range of 0.3 VDC to 3.0 VDC, the frequency range is -140 to +91 ppm; or equivalently, a tuning range of -2850 Hz to +1850 Hz. The measured tuning voltage at the nominal crystal frequency (20.48 MHz) is 1.7 V. Using the diode data sheet tuning characteristics, this voltage results in a tuning capacitance of approximately 6.5 pF.

The tuning curve data can be used to calculate the gain of the oscillator (K<sub>VCO</sub>). The data used in the calculations is taken from the most linear portion of the curve, a region centered on the crossover point at the nominal frequency (20.48 MHz). For a well designed circuit, this is the most likely operating range. In this case, the tuning range used for the calculations is ± 1000 Hz (± 0.001 MHz), or ± 81.4 ppm. The simplest method is to calculate the ratio:

$$K_{VCO} = \frac{\Delta F}{\Delta V} = \left( \frac{\Delta F_2 - \Delta F_1}{V_{TUNE2} - V_{TUNE1}} \right), \frac{\text{MHz}}{\text{V}} \quad (10)$$

ΔF<sub>2</sub> and ΔF<sub>1</sub> are in units of MHz. Using data from the curve this becomes:

$$\frac{0.001 - (-0.001)}{2.03 - 0.814} = 0.00164 \frac{\text{MHz}}{\text{V}} \quad (11)$$

A second method uses the tuning data in units of ppm:

$$K_{VCO} = \frac{F_{NOM} \cdot (\Delta \text{ppm}_2 - \Delta \text{ppm}_1)}{\Delta V \cdot 10^6} \quad (12)$$

F<sub>NOM</sub> is the nominal frequency of the crystal and is in units of MHz. Using the data, this becomes:

$$\frac{12.288 \cdot (81.4 - (-81.4))}{(2.03 - 0.814) \cdot 10^6} = 0.00164, \frac{\text{MHz}}{\text{V}} \quad (13)$$

In order to ensure startup of the oscillator circuit, the equivalent series resistance (ESR) of the selected crystal should conform to the specifications listed in the table of Electrical Characteristics.

It is also important to select a crystal with adequate power dissipation capability, or *drive level*. If the drive level supplied by the oscillator exceeds the maximum specified by the crystal manufacturer, the crystal will undergo excessive aging and possibly become damaged. Drive level is directly proportional to resonant frequency, capacitive load seen by the crystal, voltage and equivalent series resistance (ESR). For more complete coverage of crystal oscillator design, see Application Note AN-1939 at [http://www.ti.com/lscds/ti/analog/clocksandtimers/clocks\\_and\\_timers.page](http://www.ti.com/lscds/ti/analog/clocksandtimers/clocks_and_timers.page) or <http://www.ti.com/general/docs/techdocs.tsp?silold=1>.

## DRIVING CLKIn AND OSCIn INPUTS

### Driving CLKIn Pins with a Differential Source

Both CLKIn ports can be driven by differential signals. It is recommended that the input mode be set to bipolar (CLKInX\_BUF\_TYPE = 0) when using differential reference clocks. The LMK04906 family internally biases the input pins so the differential interface should be AC coupled. The recommended circuits for driving the CLKIn pins with either LVDS or LVPECL are shown in Figure 26 and Figure 27.

Figure 26. CLKInX/X\* Termination for an LVDS Reference Clock Source

Figure 27. CLKInX/X\* Termination for an LVPECL Reference Clock Source

Finally, a reference clock source that produces a differential sine wave output can drive the CLKIn pins using the following circuit. Note: the signal level must conform to the requirements for the CLKIn pins listed in the Electrical Characteristics table.

Figure 28. CLKInX/X\* Termination for a Differential Sinewave Reference Clock Source

### Driving CLKIn Pins with a Single-Ended Source

The CLKIn pins of the LMK04906 family can be driven using a single-ended reference clock source, for example, either a sine wave source or an LVCMOS/LVTTL source. Either AC coupling or DC coupling may be used. In the case of the sine wave source that is expecting a 50 Ω load, it is recommended that AC coupling be used as shown in the circuit below with a 50 Ω termination.

**NOTE**

The signal level must conform to the requirements for the CLKin pins listed in the Electrical Characteristics table. CLKinX\_BUF\_TYPE in Register 11 is recommended to be set to bipolar mode (CLKinX\_BUF\_TYPE = 0).

**Figure 29. CLKinX/X\* Single-ended Termination**

If the CLKin pins are being driven with a single-ended LVCMOS/LVTTL source, either DC coupling or AC coupling may be used. If DC coupling is used, the CLKinX\_BUF\_TYPE should be set to MOS buffer mode (CLKinX\_BUF\_TYPE = 1) and the voltage swing of the source must meet the specifications for DC coupled, MOS-mode clock inputs given in the table of Electrical Characteristics. If AC coupling is used, the CLKinX\_BUF\_TYPE should be set to the bipolar buffer mode (CLKinX\_BUF\_TYPE = 0). The voltage swing at the input pins must meet the specifications for AC coupled, bipolar mode clock inputs given in the table of Electrical Characteristics. In this case, some attenuation of the clock input level may be required. A simple resistive divider circuit before the AC coupling capacitor is sufficient.

**Figure 30. DC Coupled LVCMOS/LVTTL Reference Clock**

## TERMINATION AND USE OF CLOCK OUTPUT (DRIVERS)

When terminating clock drivers keep in mind these guidelines for optimum phase noise and jitter performance:

- Transmission line theory should be followed for good impedance matching to prevent reflections.
- Clock drivers should be presented with the proper loads. For example:
  - LVDS drivers are current drivers and require a closed current loop.
  - LVPECL drivers are open emitters and require a DC path to ground.
- Receivers should be presented with a signal biased to their specified DC bias level (common mode voltage) for proper operation. Some receivers have self-biasing inputs that automatically bias to the proper voltage level. In this case, the signal should normally be AC coupled.

It is possible to drive a non-LVPECL or non-LVDS receiver with an LVDS or LVPECL driver as long as the above guidelines are followed. Check the datasheet of the receiver or input being driven to determine the best termination and coupling method to be sure that the receiver is biased at its optimum DC voltage (common mode voltage). For example, when driving the OSCin/OSCin\* input of the LMK04906 family, OSCin/OSCin\* should be AC coupled because OSCin/OSCin\* biases the signal to the proper DC level (See [Figure 22](#)) This is only slightly different from the AC coupled cases described in [Driving CLKin Pins with a Single-Ended Source](#) because the DC blocking capacitors are placed between the termination and the OSCin/OSCin\* pins, but the concept remains the same. The receiver (OSCin/OSCin\*) sets the input to the optimum DC bias voltage (common mode voltage), not the driver.

## Termination for DC Coupled Differential Operation

For DC coupled operation of an LVDS driver, terminate with  $100\ \Omega$  as close as possible to the LVDS receiver as shown in Figure 31.

Figure 31. Differential LVDS Operation, DC Coupling, No Biasing of the Receiver

For DC coupled operation of an LVPECL driver, terminate with  $50\ \Omega$  to  $V_{CC} - 2\text{ V}$  as shown in Figure 32. Alternatively terminate with a Thevenin equivalent circuit ( $120\ \Omega$  resistor connected to  $V_{CC}$  and an  $82\ \Omega$  resistor connected to ground with the driver connected to the junction of the  $120\ \Omega$  and  $82\ \Omega$  resistors) as shown in Figure 33 for  $V_{CC} = 3.3\text{ V}$ .

Figure 32. Differential LVPECL Operation, DC Coupling

Figure 33. Differential LVPECL Operation, DC Coupling, Thevenin Equivalent

## Termination for AC Coupled Differential Operation

AC coupling allows for shifting the DC bias level (common mode voltage) when driving different receiver standards. Since AC coupling prevents the driver from providing a DC bias voltage at the receiver it is important to ensure the receiver is biased to its ideal DC level.

When driving non-biased LVDS receivers with an LVDS driver, the signal may be AC coupled by adding DC blocking capacitors, however the proper DC bias point needs to be established at the receiver. One way to do this is with the termination circuitry in Figure 34.

**Figure 34. Differential LVDS Operation, AC Coupling, External Biasing at the Receiver**

Some LVDS receivers may have internal biasing on the inputs. In this case, the circuit shown in [Figure 34](#) is modified by replacing the 50 Ω terminations to Vbias with a single 100 Ω resistor across the input pins of the receiver, as shown in [Figure 35](#). When using AC coupling with LVDS outputs, there may be a startup delay observed in the clock output due to capacitor charging. The previous figures employ a 0.1 μF capacitor. This value may need to be adjusted to meet the startup requirements for a particular application.

**Figure 35. LVDS Termination for a Self-Biased Receiver**

LVPECL drivers require a DC path to ground. When AC coupling an LVPECL signal use 120 Ω emitter resistors close to the LVPECL driver to provide a DC path to ground as shown in [Figure 36](#). For proper receiver operation, the signal should be biased to the DC bias level (common mode voltage) specified by the receiver. The typical DC bias voltage for LVPECL receivers is 2 V. A Thevenin equivalent circuit (82 Ω resistor connected to V<sub>CC</sub> and a 120 Ω resistor connected to ground with the driver connected to the junction of the 82 Ω and 120 Ω resistors) is a valid termination as shown in [Figure 36](#) for V<sub>CC</sub> = 3.3 V. Note this Thevenin circuit is different from the DC coupled example in [Figure 33](#).

**Figure 36. Differential LVPECL Operation, AC Coupling, Thevenin Equivalent, External Biasing at the Receiver**

### Termination for Single-Ended Operation

A balun can be used with either LVDS or LVPECL drivers to convert the balanced, differential signal into an unbalanced, single-ended signal.

It is possible to use an LVPECL driver as one or two separate 800 mVpp signals. When using only one LVPECL driver of a CLKoutX/CLKoutX\* pair, be sure to properly terminate the unused driver. When DC coupling one of the LMK04906 family clock LVPECL drivers, the termination should be 50 Ω to V<sub>CC</sub> - 2 V as shown in [Figure 37](#). The Thevenin equivalent circuit is also a valid termination as shown in [Figure 38](#) for V<sub>CC</sub> = 3.3 V.

Figure 37. Single-Ended LVPECL Operation, DC Coupling

Figure 38. Single-Ended LVPECL Operation, DC Coupling, Thevenin Equivalent

When AC coupling an LVPECL driver use a 120  $\Omega$  emitter resistor to provide a DC path to ground and ensure a 50  $\Omega$  termination with the proper DC bias level for the receiver. The typical DC bias voltage for LVPECL receivers is 2 V (See [Driving CLKin Pins with a Single-Ended Source](#)). If the companion driver is not used it should be terminated with either a proper AC or DC termination. This latter example of AC coupling a single-ended LVPECL signal can be used to measure single-ended LVPECL performance using a spectrum analyzer or phase noise analyzer. When using most RF test equipment no DC bias point (0 VDC) is required for safe and proper operation. The internal 50  $\Omega$  termination of the test equipment correctly terminates the LVPECL driver being measured as shown in [Figure 39](#).

Figure 39. Single-Ended LVPECL Operation, AC Coupling

## POWER SUPPLY

### Current Consumption / Power Dissipation Calculations

From [Table 118](#) the current consumption can be calculated for any configuration.

For example, the current for the entire device with 1 LVDS (CLKout0) and 1 LVPECL 1.6 Vpp /w 240 ohm emitter resistors (CLKout1) output active with a clock output divide = 1, and no other features enabled can be calculated by adding up the following blocks: core current, clock buffer, one LVDS output buffer current, and one LVPECL output buffer current. There will also be one LVPECL output drawing emitter current, which means some of the power from the current draw of the device is dissipated in the external emitter resistors which doesn't add to the power dissipation budget for the device but is important for LDO  $I_{CC}$  calculations.

For total current consumption of the device, add up the significant functional blocks. In this example, 228.1 mA =

- 140 mA (core current)

- 17.3 mA (base clock distribution)
- 25.5 mA (CLKout0 & 1 divider)
- 14.3 mA (LVDS buffer)
- 31 mA (LVPECL 1.6 Vpp buffer /w 240 ohm emitter resistors)

Once total current consumption has been calculated, power dissipated by the device can be calculated. The power dissipation of the device is equation to the total current entering the device multiplied by the voltage at the device minus the power dissipated in any emitter resistors connected to any of the LVPECL outputs. If no emitter resistors are connected to the LVPECL outputs, this power will be 0 watts. Continuing the above example which has 228.1 mA total I<sub>CC</sub> and one output with 240 ohm emitter resistors. Total IC power = 717.7 mW = 3.3 V \* 228.1 mA - 35 mW.

**Table 118. Typical Current Consumption for Selected Functional Blocks (T<sub>A</sub> = 25 °C, V<sub>CC</sub> = 3.3 V)**

Block	Condition		Typical I <sub>CC</sub> (mA)	Power dissipated in device (mW)	Power dissipated externally <sup>(1)</sup> (mW)
<b>Core and Functional Blocks</b>					
Core	MODE = 0: Dual Loop, Internal VCO	PLL1 and PLL2 locked	140	462	-
	MODE = 2: Dual Loop, Internal VCO, 0-Delay	PLL1 and PLL2 locked; Includes EN_FEEDBACK_MUX = 1	155	512	-
	MODE = 3: Dual Loop, External VCO	PLL1 and PLL2 locked	127	419	-
	MODE = 5: Dual Loop, External VCO, 0-Delay	PLL1 and PLL2 locked; Includes EN_FEEDBACK_MUX = 1	142	469	-
	MODE = 6: Single Loop (PLL2), Internal VCO	PLL2 locked	116	383	-
	MODE = 11: Single Loop (PLL2), External VCO	PLL2 locked	103	340	-
	MODE = 16: Clock Distribution	PD_OSCin = 0	42	139	-
		PD_OSCin = 1	34.5	114	-
EN_TRACK	Tracking is enabled (EN_TRACK = 1)		2	6.6	-
Base Clock Distribution	At least 1 CLKoutX_PD = 0		17.3	57.1	-
CLKout Outputs	Each CLKout Output		2.8	9.2	-
Clock Divider/ Digital Delay	When a clock output is enabled, this contributes the divider/delay block		25.5	84.1	-
	Divider / digital delay in <b>extended</b> mode		29.6	97.7	-
VCO Divider	VCO Divider current		7.7	25.4	-
HOLDOVER mode	When in holdover mode		2.2	7.2	-
Feedback Mux	Feedback mux must be enabled for 0-delay modes and digital delay mode (SYNC_QUAL = 1)		4.9	16.1	-
SYNC Asserted	While SYNC is asserted, this extra current is drawn		1.7	5.6	-
EN_SYNC = 1	Required for SYNC functionality. May be turned off once SYNC is complete to save power.		6	19.8	-
SYNC_QUAL = 1	Delay enabled, delay > 7 (CLKout_MUX = 2, 3)		8.7	28.7	-
Crystal Mode	Enabling the Crystal Oscillator	XTAL_LVL = 0	1.8	5.9	-
		XTAL_LVL = 1	2.7	9	-
		XTAL_LVL = 2	3.6	12	-
		XTAL_LVL = 3	4.5	15	-
OSCin Doubler	EN_PLL2_REF_2X = 1		2.8	9.2	-

(1) Power is dissipated externally in LVPECL emitter resistors. The externally dissipated power is calculated as twice the DC voltage level of one LVPECL clock output pin squared over the emitter resistance. That is to say power dissipated in emitter resistors = 2 \* V<sub>em</sub><sup>2</sup> / R<sub>em</sub>.

**Table 118. Typical Current Consumption for Selected Functional Blocks ( $T_A = 25^\circ\text{C}$ ,  $V_{CC} = 3.3\text{V}$ ) (continued)**

Block	Condition		Typical I <sub>CC</sub> (mA)	Power dissipated in device (mW)	Power dissipated externally <sup>(1)</sup> (mW)
Analog Delay	Analog Delay Value	CLKoutX_ANLG_DLY = 0 to 3	3.4	11.2	-
		CLKoutX_ANLG_DLY = 4 to 7	3.8	12.5	-
		CLKoutX_ANLG_DLY = 8 to 11	4.2	13.9	-
		CLKoutX_ANLG_DLY = 12 to 15	4.7	15.5	-
		CLKoutX_ANLG_DLY = 16 to 23	5.2	17.2	-
	Clock Output Has Analog Delay Selected. Example: CLKout0_ADLY_SEL = 1		2.8	9.2	-
Clock Output Buffers					
LVDS	100 ohm differential termination		14.3	47.2	-
LVPECL	LVPECL 2.0 Vpp, AC coupled using 240 ohm emitter resistors		32	70.6	35
	LVPECL 1.6 Vpp, AC coupled using 240 ohm emitter resistors		31	67.3	35
	LVPECL 1.6 Vpp, AC coupled using 120 ohm emitter resistors		46	91.8	60
	LVPECL 1.2 Vpp, AC coupled using 240 ohm emitter resistors		30	59	40
	LVPECL 0.7 Vpp, AC coupled using 240 ohm emitter resistors		29	55.7	40
LVCMOS	LVCMOS Pair (CLKoutX_TYPE = 6 to 9) C <sub>L</sub> = 5 pF	3 MHz	24	79.2	-
		30 MHz	26.5	87.5	-
		150 MHz	36.5	120.5	-
	LVCMOS Single (CLKoutX_TYPE = 10 to 13) C <sub>L</sub> = 5 pF	3 MHz	15	49.5	-
		30 MHz	16	52.8	-
		150 MHz	21.5	71	-

## THERMAL MANAGEMENT

Power consumption of the LMK04906 can be high enough to require attention to thermal management. For reliability and performance reasons the die temperature should be limited to a maximum of  $125^\circ\text{C}$ . That is, as an estimate,  $T_A$  (ambient temperature) plus device power consumption times  $\theta_{JA}$  should not exceed  $125^\circ\text{C}$ .

The package of the device has an exposed pad that provides the primary heat removal path as well as excellent electrical grounding to a printed circuit board. To maximize the removal of heat from the package a thermal land pattern including multiple vias to a ground plane must be incorporated on the PCB within the footprint of the package. The exposed pad must be soldered down to ensure adequate heat conduction out of the package.

A recommended land and via pattern is shown in Figure 40. More information on soldering QFN, formerly referred to as LLP, packages can be obtained: <http://www.national.com/analog/packaging/>.

A recommended footprint including recommended solder mask and solder paste layers can be found at: <http://www.national.com/analog/packaging/gerber> for the SQA64 package.

**Figure 40. Recommended Land and Via Pattern**

To minimize junction temperature it is recommended that a simple heat sink be built into the PCB (if the ground plane layer is not exposed). This is done by including a copper area of about 2 square inches on the opposite side of the PCB from the device. This copper area may be plated or solder coated to prevent corrosion but should not have conformal coating (if possible), which could provide thermal insulation. The vias shown in [Figure 40](#) should connect these top and bottom copper layers and to the ground layer. These vias act as “heat pipes” to carry the thermal energy away from the device side of the board to where it can be more effectively dissipated.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Samples (Requires Login)
LMK04906BISQ/NOPB	ACTIVE	WQFN	NKD	64	1000	Green (RoHS & no Sb/Br)	SN	Level-3-260C-168 HR	
LMK04906BISQE/NOPB	ACTIVE	WQFN	NKD	64	250	Green (RoHS & no Sb/Br)	SN	Level-3-260C-168 HR	
LMK04906BISQX/NOPB	ACTIVE	WQFN	NKD	64	2000	Green (RoHS & no Sb/Br)	SN	Level-3-260C-168 HR	

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
